I am experiencing a horrible problem with downloading FTP files from FTP sites
... This is the oprocedure I follow:
1) FTP material from the FTP site to the IBM 370 mainframe..
2) KERMIT the material from the IBM maionframe to my Atari ST.
-
The problem with this is nothing I have downloaded thus far has executed nor de
compressed propwerly.. I am decompressing the file FINE.. THAT is not the prob
lem (I tried to download a .prg file and IT did not work!)
-
What am I doing wron? I did the FTP BINARY.. that idea has been ruled out..
Do I have a protocol problem? Is it impossible to download a binary file from
a CMS mainframe to an Atari? Help?!
-

Is this an open offer? If so, I may just take you up on this for the ST Zoo port. The Zoo source is available and I don't have any objections to having Zoo use GEM if it has been launched from the desktop. As a matter of fact, it would make alot of GEnie users extremely happy :-)

If either of you gentleman are willing to do the GEM portion of Zoo, contact me in E-mail and we'll discuss it more in-depth (ST Zoo may be going through some significant changes now that we're merging with the mainstream Zoo source).

>have ten times the software available than the new TOS versions. And how

As buggy as TOS 1.0 is and as much as I would like to upgrade, I can't
justify spending $80-$100 for TOS 1.4. When you consider that a new 1040STe
CPU (which has the blitter chip, TOS 1.62, easy RAM expandability, stereo
sound, and a larger color palette) sells for $399, selling my 1040ST CPU
and buying a 1040STe CPU would end up costing about the same as TOS 1.4.
But since I really don't need the bells and whistles of an STe, I'll just
keep my old 1040 and try to patch TOS 1.0 bugs through TSR programs.

Now I know what people mean when they say Atari provides upgrades ONLY
by buying new computers.

>| (Al Stewart) |

Ah yes, a message from the Europe, the market for Atari.

Unforutnately, just because Atari sells a product in Europe does
not mean that it will ever be sold here in the USA.

For example, just how many different models of IBM PC clones
did Atari sell in Europe (or even Canada)?

Atari has NEVER sold a PC clone here in the USA.

Atari sells many products overseas that can not pass the USA FCC
inspection here. I wonder why that is so? Are radiation emissions
tests more restrictive here in the USA then in Europe? why does
atari have some many recurring problems passing FCC tests?

So, its is great that you see the ST Book over there but that
means nothing for us here in the USA.

Don't you remember the STacy?

It was NEVER FCC Class C approved, so you couldn't legally
buy a STacy for home use. As a result not many sold here.

BTW, did Atari ever sell the CD-ROM drives over in Europe?

That is another vaporware here in the States.

So, if you enjoy buying new Atari toys (neat game machine that TT huh?)
then I guess you need to move to Germany!!

Atari sucks in the USA!!

>Folks, its the ripoff of the century, especially when Apple manufactures
>IIFx motherboards for about $500 bucks a piece.

I wonder about that $500 price cause the 40 MHz 68030 CPU must cost
a couple of hundred bucks by itself. But I doubt that the IIFX costs
more then a grand, and they sell it for $5,000 so Apple seems to be making
a fortune.

But, if it is true then how come the TT030 with 8 meg RAM and 50 meg
drive retails for $3800?? I can't believe that the TT030 is more expensive
to build than a Mac IIFX. So, shouldn't the TT030 be under 2 grand not
pushing four?

>
>--Greg

I agree that the mac hw is just too expensive but look at the software
that is available. and then decide if you can justify the hw costs.

for me, I need a UNIX X windows machine and can't wait for Atari to
release their ATX (if they ever do now that they let their UNIX Guru go).

So, if I get a Mac iici for $4000 ($3300 for a IIci with 5 mgs RAM, 105mg
hd) + $600 for color monitor/video board + $150 for keyboard I can use
my Sony SMO optical drive with it for free. then I can put AUX on my
optical drive and run MAc off of my hard drive and off of the optical.

Plus I can get a CD ROM drive NOW with real software for it.

And for less than a TT030 with ATX would cost. The TT030 ATX package
is going to cost $2,000 from what I hear.

And the Mac isn't likely to be an orphan computer in a couple of months.

So, yes the Mac's hardware is way overpriced but you can get gigs and
gigs of great Mac apps and stuff on CD ROM right now!!

Even NASA is releasing CD ROMs for both the PC and the MAC.

so, for me, buying a Mac is much more logical (even with Apple's
inflated prices) than buying another Atari product.

It might be that the laser printer is an Atari and nobody wants
that dog!!

>very well with spectre as well as atari applications.
>Make me an offer.
>
>For anyone using an ST its just great.
>----------------
^^^^^^ ha ha ha!!

I had one of those dogs and sold it and bought a real
laser printer.

The SLM804/605 require an ST with a minimum of 2.5 megs of RAM
as an data is preformatted in ST RAM before being dumped to the
printer.

Also, the various emulators (diable 630,epson etc) are all buggy
as hell.

I have seen used HPLJII compatible laser printers for under
a grand. and they don't require a 4 meg ST to use.

Just face it it takes a special person to buy a SLiMe laser
printer these days.

And for you all Atari Apologists, I know that the SLiMe is
greased lightning because of its DMA interface, but have you
ever tried a fancy laser printer on a PC with the vidoe interface?
Just as fast as the SLiMe, so there!!

GEMINI works like this too. When I sometimes use GEMINI, it provides an
extra window for 'mupfel', the commandline-shell. You can start TOS and TTP
programs inside of this window, which has worked with all pograms I ever
worked with. You even will be able to CUT/PASTE the Output of these programs
to the Clipboard. Try GEMINI (We are on version 1.21 now) !

Don't forget that TOS 1.04 (former 1.4) is not simply a TOS without the bugs
of TOS 1.0 but its performance is much better than with the older versions.
Especially hard disc users are aware of this.
And one more thing: For a new DOS version (delivered on some cheap discs)
you pay more than for a rom version of a much more complex system, namely TOS.

I have compiled GNU Tar v1.10 under MiNT v0.8 with patchlevel 10 of the
libraries. So now I can use commands like 'gtar vtzf' for viewing compressed
archives. There are still a few bugs I am ironing out, but the major features
of GNU Tar seem to work o.k.

> features, so it might not be legal).

It's legal -- or at least, there is a legal way of doing it. (Details on request.) I have a startup module for Sozobon C that will work for a PRG or an ACC. But there are some significant shortcomings, such as no argument parsing, no stream i/o (including buffered file i/o), no support for the environment, etc.

I don't know if it's possible (or desireable) to write one all-encompassing startup module. There are too many rules that a DA can't violate. The dual-mode approach has its uses, but in general, if you want to write a Desk Accessory, then write a Desk Accessory, and if you want to write a program, then write a program.

>
< extensive zoo vs lharc test deleted >

Thanks for an excellant test article. The only real world test you missed was extraction of existing archives, where lharc is a considerable improvement over it's predecesors. I'm sure zoo rates highly there too. My one big gripe with zoo is that it breaks multiarc, a nice muli archiver shell I discovered shortly before zoo 2.1's release. With the old version of zoo, the command x// extracted all files recursively too folders, now the only command that does this is -extract, which doesn't fit on the multiacr command line. (one problem with Gem dialogs is that the programmer must anticipate the maximum length of any command ever to be used. If he underestimates, something always comes along that is too long. Another good example is Gus, which truncates long subject lines.) Is my version of zoo broken, or is there a switch that I missed?

You could use Arcgsh 3.5. It offers a nice GEM interface to Zoo (and some other archivers) with full Zoo functionality and starts up automatically upon double-clicking on a .ZOO file. (Well, actually Arcgsh does not yet support Zoo's new 'h' option. However, Arcgsh 4.0 is in the making, which will have the 'h' option. And for those LHarc users among you :-(it will come with a configurable LHarc interface. You can adopt it to just that LHarc variant you like, resp. you are forced to use.)

Source record: 228503

I have just had a look at your rather long posting, well for one thing
that I find that it is very biased to ZOO 2.1..

You allready new and use ZOO and have a source listing, so there was no
real need to read the manual..??

LZH201X has a few New commands, they could only be found by reading the manual,
never blaim the programer if you have never read his manual.

BUGS. I think you will find that the Date/Time Problem is possible caused
by TOS 1.2, I have tested some files and never found a date or time probem,
but then I do use TOS 1.4.:-)

Directory delimiters can be changed with the -s switch, \ to /.

The progress indicator can be turned off with the -n switch, and
all outputs with the -d switch.

ARGV is claimed to be supported, but I have no way to test it, there
was some comments in the Doc's that Thomas had fixed ARGV in version 201D.

How does gulum work with a extended inputs, is it automatic when
command lines are to long.?

So Bill spend some money and get TOS 1.4, you could find things a lot better,
gee I could not live with out my Move Files..:-)

>ever tried a fancy laser printer on a PC with the vidoe interface?
>Just as fast as the SLiMe, so there!!

Geez, Richard - Give us a break! I am sitting here typing this on
a 4Mb 25Mhz 386DX with a locally attached HP LaserJet III with 4 Mb
of RAM. It takes FOREVER to get something that has graphics in it
to print. And half the time appears to be download time to the
printer RAM. Besides I could make MORE use of the RAM if it were in
the PC than on the printer. (Nothing like dedicated high-cost hardware!)
I would MUCH rather have the Atari setup. Please go and buy your Mac
and leave us alone.

R.C.G.

One thing I have noticed about the computer world is that there are a lot of real bone-heads in it, like as in thick skulls. Atari and Amiga users are the WORST of the lot. Get off your high-horses guys, you are arguing over a hunk of frigging silicone and some wires! That's right, go home, look at your ST, and think about what it really is, a lump of PLASTIC and METAL, and that is all, it has no importance. GET A LIFE! All computers are good a different things, and that is all there is to it! I like them all, I use them all (although the consulting lab I work at during the day recently got rid of the Amigas, rats). Yep, I even like Amigas, a lot, I like STs, a lot, I like Macs, a lot, and DOS machines, a lot... But, they are all computers, and that is all, not worth arguing over. Buy whichever one you like or can afford. For the office, Mac is king, it is so easy to use a total idiot can set one up and get it working in an hour. Macs & STs are both really excellent DTP machines. Amiga has the Animation department, and DOS has big industry (how many STs do you know that are hooked up directly to, and running, CNC laser modeling devices, robot die polishers, or similar devices?) But, you can do any of these things on any of the machines (allowing for software availability).

As for price, I can get a MacIIci with 5megs Ram and 80Meg hard drive, with extended keyboard, for $2880 (student discount!). This is a TRUE 25mhz 68030 machine (why did Atari screw up the TT with a 16mhz bus system? arrgghh!!), with 3 internal expansion slots. It is a very good computer, it is not an ST, but it is still a damn good machine, just like all the others.

Argue over something real, or hey, go outside and DO SOMETHING! (Have you noticed that the world is falling apart while you argue over your precious hunk of wires?)

3020. NEC P3200 24-pin printer

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 15:45:49 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1991Sep27.154549.28869@sactoh0.sac.ca.us>
Source record: 228531
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just purchased an NEC P3200 24-pin printer (New at a local store for $209, $100 less than even the Bay Area) and I need some help.

The printer works just fine, but I use GDOS and Microsoft Write, and the drivers do not support the Graphics Print I would need for different fonts, etc.

The NEC 7710 driver doesn't work.

I have tried setting up my GDOS for an Epson FX printer (which the NEC can emulate) but Graphics Print is a no go, although Meta print to a .GEM file works.

So, using GDOS and Write, is there a driver available so I can use to do graphic printouts?

Also, the print screen driver in the ST doesn't print a decent screen. Any help here too?

Source record: 228509

tho i trust bill shroka and the atari guys to "do the right thing", i
still prefer rainer's suggestion for a separate GEM shell for archivers.
with virtually any other sort of program, be my guest (not that i am
some sort of programming cop) and load it up with GEM functionality.
this is actually a good idea IMHO.

i just get shivers down my spine when i think about proposals to muck
around with archivers. i can easily see someone else picking the code
up and introducing incompatibilities in it, even inadvertantly. and
i think this paranoia of mine is at least somewhat justified since we
have a track record for doing this (lharc). if atari would maintain
the only "official" GEM version of zoo, this, too, would be acceptable.

before screwing around with zoo, i would URGE you to contact zoo's owner
and check with him on this issue. i believe the copyright restrictions
in zoo should be looked at as well. any changes to zoo that make it
incompatible require you to stop calling it zoo. at a minimum, you should
bounce back these changes to rahul dhesi so he can incorporate them in
the next "official" zoo release, properly #ifdef'ed for atari...

flame away...

>improvement over it's predecesors. I'm sure zoo rates highly there too.

you're welcome! i did test extraction of existion archives, the ones i
made in the test itself. in those tests, zoo and lharc were of equal
speed (in one of the 2 limited tests, however, zoo was faster by 2 seconds).

> My one big gripe with zoo is that it breaks multiarc, a nice muli
>archiver shell I discovered shortly before zoo 2.1's release. With the old

contact multiarc's author and have him/her fix it. if multiarc is shareware
and the author requests $$$ for it, he should fix it, if only to remain
current and viable. marketing 101...

>version of zoo, the command x// extracted all files recursively too
>folders, now the only command that does this is -extract, which doesn't
>fit on the multiacr command line. (one problem with Gem dialogs is that

i have used "zoo x//. archive" without problems with zoo 2.1. i always
include the ".", however.

>the programmer must anticipate the maximum length of any command ever to
>be used. If he underestimates, something always comes along that is too
>long. Another good example is Gus, which truncates long subject lines.)

multiarc needs fixing. you might also consider one of the other GEM shells
for zoo.

> Is my version of zoo broken, or is there a switch that I missed?

don't know that. i do know there were 2 (at least?) versions of zoo 2.1
but i use the one that was posted on comp.{binaries,sources}.atari.st
by the moderator, steve grimm. you can see the version info by executing
zoo with no arguments. i included this in the report.

3023. question about Megafile 30

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 16:17:32 UTC
From: darius@isasun-1.edm.isac.ca
Message-ID: <1991Sep27.161732.14365@edm.isac.CA>
Source record: 228526
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Inside my megafile 30 is a seagate ST238R hard drive; the R means RLL format. Am I correct in assuming, then, that the controller in the megafile is an RLL-to-ACSI board? Does this mean that if I want to swap the drive mech., the only choice I have is to use an RLL drive, or is it possible to use some other type of drive?

Please be patient with me if this question seems stupid. I'm not a hard drive expert, just someone who wants an easy way to get a bigger, faster hard drive.

>I have just had a look at your rather long posting, well for one thing
>that I find that it is very biased to ZOO 2.1..

fair enough. i am known to be anti-lharc (my claim to fame? :-)

>You allready new and use ZOO and have a source listing, so there was no
>real need to read the manual..??

huh?

>LZH201X has a few New commands, they could only be found by reading the manual,
>never blaim the programer if you have never read his manual.

i did execute both programs withoout args and read the info on the screen.
i also read the readme for zoo 2.1. yesterday, i also skimmed the lharc.man.
it said nothing about altering how timestamps are managed on existing files
so this is a bug.

i did not find anything with either that would 1) improve speed, 2) improve
archive size, 3) fix lharc's bugs over and above the way i specified i
used each. i DID list the commands i used for each process. if there are
alternate methods, enlighten me, please...

>BUGS. I think you will find that the Date/Time Problem is possible caused
>by TOS 1.2, I have tested some files and never found a date or time probem,
>but then I do use TOS 1.4.:-)

absolutely no excuse for it not working on ALL tos versions. even the 1.0
i still have in my old 1040. i have no way of knowing for sure, but i
would guess that there are more atari ST systems running a pre-TOS 1.4
than any newer TOS release. it should also work correctly with command
shells of any sort (gem shell, CLI, whatever). line arguments, after
all, are how it knows what to do.

>Directory delimiters can be changed with the -s switch, \ to /.

thanks for the info. tho this is a very minor detail, considering the
other issues i raised (speed, size, and BUGS).

>The progress indicator can be turned off with the -n switch, and
>all outputs with the -d switch.

yes, i found this out too. i prefaced my remark with "nitpicking" indicating
i was reaching on that point. my preference would probably be to have
the indicator OFF unless aske for, but this is no big deal.

>ARGV is claimed to be supported, but I have no way to test it, there
>was some comments in the Doc's that Thomas had fixed ARGV in version 201D.

i do (and did). lharc 2.01e DID cause my system to crash. if there is a
newer version than this, send it to me and i will retest. you never run
across this because you never run CLIs. if you did, your system would
likely crash as well.

>How does gulum work with a extended inputs, is it automatic when
>command lines are to long.?

gulam uses the mark williams ARGV scheme later adapted (after slight
changes) by atari as the "official" way of doing this. anything else is
not sanctioned. in gulam, you enter the command "setenv env_style mw"
to turn this on. for further info, i direct you to the specification posted
here some time ago. it is also in the archives, i believe.

>So Bill spend some money and get TOS 1.4, you could find things a lot better,
>gee I could not live with out my Move Files..:-)

spending money has never been my problem :-). i have 2 ataris (mega 4
and 1040ST, megafile 60, sh204, at least 3 monitors, etc, etc,etc). i
should upgrade (one of these days) but that is still no excuse for lharc
not to work properly on 1.2 and 1.0 (if it is in fact a TOS 1.4
incompatibility as you suggest). as far as i know, the Fdatime GEMDOS call
works the same in all TOS versions. it is used to set file timestamps.

Speaking of Zoo, I had some problems with it last night. Being sick of the zillions variations of lharc I decided to unpack all my .lzh files and zoo them with zoo ver 2.1. (since the compression is about the same, and zoo is guaranteed to work on all platforms) But altough the first couple of times it was doing fine, suddenly it stoped working properly: I was trying to create a new archive-file containing the files of a directory andf zoo2.1 gave me 3 bombs. I used the command: zoo21 ah// x.zoo dir (actually I was experimenting with the command line). The thing is that zoo21 bombed me every time I tried to commpress files maintining the full path-names......while zoo2.01 was doing that without problem (but the compression was significantly lower).

Anyway, I think I read in this newsgroup that the version of zoo 2.1 stored on atari.archive (I got my copy from there) has some problems..

Do I remember correctly? If yes,. could someone please tell me where can find
a "clean" copy of zoo ver 2.1?

thank you.....

Have you thought about using your superfast text-blit routines in a
off-screen buffer and then blit the buffer onto the screen with the
VDI?
This would not cost much time, but it would work on all ST's and TT's
and on yet unconcived machines and graphics cards.
You can blit the buffer to the screen, when there is a halt in the incomming
serial stream or when the serial buffer get below a certain mark, or the
simple way - make a text-line and blit it to the screen, make the next...
Ofcause - you might want to include the v_gtext() option too, so that
people can use outline fonts in the terminal window...

>Now, I have some problems which I hope some of you could help me with:
[...]

>3) My application sees AC_CLOSE messages AFTER the desktop has been
> taken over by a double clicked .PRG application. Am I doing something
> wrong here - I thought AC_CLOSE messages was sent to .ACCs *before*
> the Desktop was closed down?

This is because the program you start, don't use the AES. In the old TOS
the ACCs won't get their AC_CLOSE message until it is their turn (and the
dispatcher runs on AES calls) this means that there have to be a certain
number of AES calls before all ACCs have received their message. In the
new TOSes 2.0x and up, the AES makes sure that all ACCs get their messages
before the appl_exit call terminates. It is therefor safe to allocate memory
on TOS 2.0x and up.

On lesser TOSes you should only allocate memory on the desktop.
- it is a good idea anyway...
You can check if you are on the desktop with the PID pointer in the
system header. (your ACC start it's life on the desktop - allways!).

On the new TOSes you get a AC_CLOSE when the rez. is changed:

case AC_CLOSE: if (OnDesktop()) Panic_rez_change();

This is a really nice trick, not that is have anything to do with your questions though...

Hi all,

I've just got an HP 97458 (I think) hard disk. Unfortunately I don't have
any info on it. I think its SCSI (connectors look similar), but I'm not much
at identifying disks from their cases (I'm not particularly happy about
plugging it into my ICD SCSI on by ST to test it).

Can anyone give me any information on this mystery disk or any clues as
to connecting it to my ST.

Cheers

...Les...

There isn't directly a cartridge port, _*BUT*_...

The "120-pin Expansion Port" (my/atari's name for the "system bus") has
*all* the signals neccesary to _*create*_ a cartridge port. We have
encouraged/are encouraging third parties to make a _*very*_ simple board to
convert the "Expansion" to "cartridge". (two connectors and a PCB... no active
parts at all).

Oooooo Piet, I'd LOVE to get my greedy little hands on a startup module
like that! There's been some demand for a screen saver like AFter
Dark on the Macs (which loads different modules to run as the screen
saver effects) on GEnie, and I thought I'd write on... Unfortunately,
I'm not enough of an assembly hack to write the startup module you'd
need to Pexec() from inside an accessory, and not crash the ST...

Has anyone got a startup module that'll let me run the program from an
acc via Pexec()? Or some other means or running an external program
from an ACC?

Just for your info: I just got informed from atari Norway that I can buy atari-unix NOW. So it shouldn't take too long 'till you can buy it in the US, since the Norwegian atari-market is (at least) as bad as yours. In fact, I was very surprised to see that we got the unix before you guys !

3033. Cartridge Port for STBooks

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 19:24:01 UTC
From: trh@atari.UUCP
Message-ID: <3085@atari.UUCP>
Source record: 228522

As I said in the earlier post, the "120-pin Expansion Port" has all
of the signals neccesary to create a cartridge port, and we (Atari) have
encouraged/ are encouraging third parties to make a _*very*_ simple board to
convert from Expansion to Cartridge. (two connectors and a PCB... _*no*_
active parts)

What I wanted to add is that I have built such a board in the lab,
and it works just fine.

THANK YOU for bringing a bit of reality into this "discussion." They are
only computers. They are just tools. Some may be easier and more
enjoyable to use but that is up to the individual. I happen to like my
ST and will probably buy another as soon as I save up enough money, but
am seriously considering buying a "brand name" computer _also_ so that
I can run some other app's that I can't right now on the Atari.

Anyways, instead of arguing about different computers (which is all
subjective anyways), why don't you start focusing your energy into more
important things like the environment, Middle East, AIDS, etc.
Try to make a change in something that you feel needs to be changed in

the government.

Regardless of the fact that most of your points were wrong,
your series of pointless whining Atari bashing posts are getting irritating.
It is counter to this newsgroups charter and is a waste of everyones time.

I have not only seen but have had the privilage of using the ST Book
for about 2 hours one night. It is real, it will be in the US, and it is
a very impressive notebook computer. Atari most definately has done
this one right.

I definately would like to see Atari have a larger presence in the
US market and I certainly don't support many of their practices and policies,
however I prefer to concentrate on what is right with Atari: Tha machine.

I decided this week to try soundtracker. I found a couple of soundtracker players, but most of them didn't word. Some explicitly stated to work only on low res (I have monochrome). The only one that worked on mono was player, which is described as 'lame'. Is there a good one for mono?

Secondly what is the difference between Soundtracker (files) and Noisetracker (files)?

> One thing I don't like about ZOO is that you can't add recursive (at
> least I can't get mine to eat 'zoo a// a large/*'.

Sure you can. Storing entire directory structures is one of the strengths
of ZOO (the other being portability). Make sure your shell isn't eating
slashes; that will drive you up the wall in short order. You may have to
quote the arguments; if you type zoo ah// folder/* and zoo gets ah/ instead,
it'll whine and not do the job.

Another way is to use the novice command:

zoo -backup 'dir/*'

Note that -backup and -restore are not documented in the manual. They
appear to be ST extensions.

3038. problems with zoo 2.1 recursive

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 20:36:48 UTC
From: rosenkra@convex.com
Message-ID: <1991Sep27.203648.2349@convex.com>
Source record: 228517

```
[ another long one... ]

i was disturbed about recent allegations that zoo 2.1 has problems with
recursive directory storage. so i tested this with my version of zoo
(the one i have, that is; i did not do the port).

i started with a directory structure like this:

% ls -lRF l1

drw------- 1 u 0 Sep 27 14:56 l1\

j:\tmp\l1:
-rw------- 1 u 2303 Sep 4 03:16 file1
drw------- 1 u 0 Sep 27 14:57 l2a\
drw------- 1 u 0 Sep 27 14:57 l2b\

j:\tmp\l1\l2a:
-rw------- 1 u 2303 Sep 27 14:57 file1
-rw------- 1 u 2303 Sep 27 14:58 file2
-rw------- 1 u 2303 Sep 27 14:58 file3
drw------- 1 u 0 Sep 27 14:57 l3\

j:\tmp\l1\l2a\l3:
-rw------- 1 u 2303 Sep 27 14:58 file1

j:\tmp\l1\l2b:
-rw------- 1 u 2303 Sep 27 14:57 file1

i did this:

% zoo a// rrr.zoo l1
("zoo -backup rrr.zoo l1" will also work)

listing this gives:

% zoo -list rrr.zoo

Archive rrr.zoo:
Length CF Size Now Date Time
-------- --- -------- --------- --------
2303 38% 1423 4 Sep 91 03:16:56 0526 l1/file1
2303 38% 1423 27 Sep 91 14:57:38 0526 l1/l2a/file1
2303 38% 1423 27 Sep 91 14:58:06 0526 l1/l2a/file2
2303 38% 1423 27 Sep 91 14:58:08 0526 l1/l2a/file3
2303 38% 1423 27 Sep 91 14:58:14 0526 l1/l2a/l3/file1
2303 38% 1423 27 Sep 91 14:57:40 0526 l1/l2b/file1
-------- --- -------- --------- --------
```

```
13818 38% 8538 6 files

then extracting:

% mkdir tmp (create a temporary directory)
% cd tmp (move to that directory)
% zoo x//. ..\rrr.zoo (extract, preserving directory structure)
("zoo -restore ..\rrr.zoo" will also work)

this resulted in (i am still in the temporary directory at this point):

% ls -lRF l1

drw------- 1 u 0 Sep 27 15:34 l1\

j:\tmp\tmp\l1:
-rw------- 1 u 2303 Sep 4 03:16 file1
drw------- 1 u 0 Sep 27 15:34 l2a\
drw------- 1 u 0 Sep 27 15:34 l2b\

j:\tmp\tmp\l1\l2a:
-rw------- 1 u 2303 Sep 27 14:57 file1
-rw------- 1 u 2303 Sep 27 14:58 file2
-rw------- 1 u 2303 Sep 27 14:58 file3
drw------- 1 u 0 Sep 27 15:34 l3\

j:\tmp\tmp\l1\l2a\l3:
-rw------- 1 u 2303 Sep 27 14:58 file1

j:\tmp\tmp\l1\l2b:
-rw------- 1 u 2303 Sep 27 14:57 file1

this works without problems, at least none that i can see. file timestamps
are correct and it did not crash my machine :-).

IMPORTANT NOTE: in order for this to work, you need to set
the TZ environment variable correctly. i use:

setenv TZ EST5EDT

however, RCS is screwed up (actually, i think it is probably
the gnu C library for timezone at the release of GNU C that
apratt@atari compiled RCS - infinite thanx, alan!). it needs

setenv TZ :EST5EDT

to function correctly. POSIX sez something about both forms,
with and without the colon (:) but i don't recall what it is
at the moment. the GNU C library attempts to be POSIX compliant
(which is a good thing).

note that without TZ set (as most users of the desktop only will
more than likely be used to), unpacked files are 1 hour newer
than they should be (i.e. l1\file1 is Sep 4 04:16...). i am not
aware of any way around this short of setting the TZ environment
```

variable. for desktop users, it probably won't make too much
difference anyway if the file timestamp is off by an hour.
and it may only be off an hour because of daylight savings time.
that is what the "EDT" in TZ flags.

i would expect the directory times to bear a timestamp of the time at
which they are created. even unix tar does that. i generally have TZ
set to "EST5EDT" and change it to ":EST5EDT" when i use RCS. i have not
checked the update notes on the GNU C library about any changes here in
the last 6 months, or since RCS was released (perhaps bammi can comment).

by the way, RCS is Revision Control System, a set of programs to manage
revisions in files, typically source code and documentation. it has its
roots in unix. apratt@atari did the port and posted it to atari.archive.
it is another fine piece of software making life for programmers much
easier. i would encourage more of its use.

here are the vital statistics for this version:

```
% ls -lF c:\local\bin\zoo.ttp

-rw------- 1 u 83275 Jul 24 19:17 c:\local\bin\zoo.ttp*

% sum c:\local\bin\zoo.ttp

34636 82

% zoo

zoo 2.1 $Date: 1991/07/14 22:39:26 $
[ instructions deleted ]

author (port): Bill Shroka (bjsjr@NCoast.ORG)

compiler: gcc 1.40 (from readme.st file, library patchlevel unknown)
```

this one was posted to both c.sources.a.st and c.binaries.a.st in 2 seperate
files. probably they are named "zoo21b.zoo" and "zoo21s.zoo", binary and
source, respectively. don't quote me on that, however. bill shroka did a
fine job on the port. it, for me anyway, functions very well.

the other one i have has size 86572 and is dated 13 July 1991. it came with
source in an archive called zoov21.zoo. it was ported by Scott Kolodzieski
(scott@sparc1.stevens-tech.edu). i have never used this version (yet). this
version does not support -backup/-restore nor does it support the (atari-
only) extension "a//" from what i can see. this was uploaded to atari.archive
but was not posted. note that the "a//" extension will probably find its
way into the "official" zoo sooner or later. for more info, see bill shroka's
readme.st file in the archive. to use the kolodzieski version, you need to
do "find . -print | zoo aI archive", i presume, just like unix. otherwise
make a list of files to archive in another file and do "zoo aI archive <list".
i prefer shroka's scheme (-backup/restore or a//). and yes, i know these
new options are not (yet) "official" as far as i know. however, you can
always use the "aI" method if you want 100% compatibility. in any event,

the FILE FORMATS themselves are not changed at all. the user interface is, slightly, and only by addition, not alteration. this was careful and deliberate by all accounts.

i would suggest we synchonize on the shroka zoo 2.1. it can be retrieved from either atari.archive or the binaries archive.

hope this helps...

I encountered this problem just last weekend (when I got my new STE). It indeed only recognizes TOS 1.60. I managed to fix it for my version by using FORTH to suck the file into memory and disassembling until I found the problem. As it turns out, the 0x160 is pretty close to the front of the file. All that has to be done is to change the 0x160 to a 0x162. It should work fine then.

Terry

|> tests more restrictive here in the USA then in Europe? why does
|> atari have some many recurring problems passing FCC tests?

I can't tell you why Atari has so many problems getting FCC certification for its products, but I can tell you that the emissions requiremnets in Europe are _not_ significantly less stringent than they are here. The biggest difference is that the VDE (German equivalent of the FCC, also the standard in Europe) is self-ceritfying. That is, when you receive VDE approval from a lab in the U.S.A . which is certified to give VDE approval, _that's_ _it_ unless there are problems. After getting your stuff appro

ved for FCC class B at a private lab, you still have to file paper work which can take months to go through if the FCC decides to audit you.

*** This part is only speculation ***

If Atari has indeed given the FCC stuff that wasn't really up to the requirements before, that would explain why their stuff might be audited so often.

*** End speculation ***

|>

You only need FCC class -B- for home use. FCC class A is industrial use. That's what Stacy has (or _had_ last I heard). I've read that there is, in fact, an FCC class C for things

that can be operated on airplanes, but I don't know if that's true or not.
|>
|> BTW, did Atari ever sell the CD-ROM drives over in Europe?

There's a store in San Francisco that sells the CDAR-504. CD-ROM player.

arghhh! dont do this. if args are not available, in the gcc
startup module, it still creates argv[0] == "", so the min value
of argc a program will ever see is 1. this is true for acc startup
too. the reason for doing this is that it is required by Posix (in
case you were thinking that these guys just made a random decision :-)

cheers,

I want to purchase a good vidio setup for my Mega ST.
I'd prefer 1024 X 768 pixel modes for both color and monochrome, and
I hope to be able to handle standard LO-REZ, MED-RED, and HI-REZ
modes as well (For existing software that doesn't check the screen
size... or that does check and asks you to set it to LO-REZ or whatever.

I intend to do an SST (Gadgets by Small) upgrade on the machine as well...
and wish to maintain as much compatability as possible.

Prices and impressions Please!!!
(Especially BARGAINS!!!)
(email too, my news-server expires things in less than 24 hours)

I agree with you 100% here, Matthew. In preparing to move I had to go through four years worth of Start!, ST-Log, Current Notes, ST Xpress, and ST-Informer back issues to decide on which to save.

I found myself with far more issues of CN than the others! The only "glossies" I hung on to were a few of the ST-Logs (remember "hardware modifications"? and some of the British ones.

Maybe, when you can't fill your pages with two-page color ads and reviews that somehow manage to support them over the others... You have to have good material instead!

> *** New Zealand.. * not like a dying light globe ***

I can't be positive about this, but I am fairly sure. Gulam uses the
Mark Williams C Extended Argument Passing system, which is close to the
system that ARGV uses. It *ISN'T* ARGV though, so that may be why Gulam
crashes. Okami supports ARGV Parameter Passing, if you can figure it
out. I can't read German, so it hasn't been the easiest method to
use...:) Lharc 2.01E works fairly well. The only problems I have had
with it are when trying to compact files for AFX Pack. Sometimes it will
not compact the files properly (I will get a read error when trying to
access .PAS files, so far.) If I ever get enough money, I'll register
the thing and the version that you get for registering might not have
these problems. All in all, though, Thomas Quester's programs are some

of the best available for the ST. Especially PFX Pack and AFX Pack.
I'll check to see how well Lharc 2.01E supports ARGV, but if the author
says it is supported it is a good bet that it is. I also read the
article containing the test, and it did seem very biased toward ZOO. The
writer perhaps should have read the documentation before complaining
about the program not being able to do certain things. The actual
compression rates seemed fairly even, whih is a good thing. The next
sries of compression programs will all be trying to beat each other, so
we might see even better compression routines. There has to be a limit
on how good compression can be though...

>file :-). if you have an open mind, read on for enlightenment...

As the person responsible for the ST version of Zoo (and one of the many versions of LHarc), I guess I should make a few comments here. The following will be a highly edited version of Bill's article.

>summary: zoo 2.1 is just about as fast as lharc 2.01e and
> makes files about the same size.

Agreed. Lharc 2.01e is undisputedly the fastest LHarcer available for the ST. The slow version of Zoo (the current version) is almost as fast as lharc 2.01e but is much, much more compatible across (and on the same) platforms. That's why I gave up on LHarc: There was no central development team to make decisions on design.

>test platform is mega4 (4 MB) 8 Mhz, TOS 1.2, using gulam CLI. environment
>included TMP=ramdisk and TEMP=ramdisk (i confirmed there was no use of
>hard disk by observing that no disk access lights went on).

Just a note(for those interested): Zoo doesn't use any type of TMP variable.

> lharc 2.01e (questor, Assemblerversion vom 14.07.1991)
> zoo 2.1 (1991/07/14 22:39:26)
>
>i would call this "equal" technology since the versions were realized
>on the same dates! zoo was compiled with GNU c (gcc) though i do not know
>which version. i confirmed this by both "printstk zoo.ttp" which did not

I used GCC 1.40. I'm always on the cutting edge of the GNU stuff :-)

>fail, listing a reasonable stacksize (16k) and by "strings -10 zoo.ttp"
>which listed ascii strings that would appear if gcc was the compiler.
>it also looks like zoo 2.1 was compiled with MiNT so that it could be
>"backgrounded" in a multiprocessing environment. i could be way off base
>here, however. i just spotted the string "MiNT" in the .ttp. i saw no

I used Patchlevel 72 (I think) of bammi's library, which is slowly merging with Eric's mintlib. I use the 16K stacksize (as opposed to all available memory) so that Zoo can be used in the background MiNT or RTX.

>evidence that lharc was equally endowed. it also looks like zoo may support
>UNIXMODE tho i don't use it myself. UNIXMODE allows configuration so that
>forward slashes "/" can be used in file paths as well as backslash "\".

Yes, Zoo does support UNIXMODE though I don't use it either.

>zoo21: extract files:
>
>this took 25 seconds. the times and dates of extracted files were exactly
>correct (same dates and times as files in the archive).

Though the times and dates were correct for you, there are some known bugs in
Zoo time code, especially the timezone stuff. I have been informed that they
have already been fixed for the next version.

>--
>test 4:
>
>i tested each program's ability to be interrupted. during archive creation,

The GCC-ST library is a tribute to Jwahar Bammi and Eric Smith (and all of
the other contributors). It makes ports like Zoo a breeze. Thanks guys.

> - the size of the executables is significantly different. about 2x

> archives though this is a twist on that concept.

In these days of massive sized hard drives I personally find executable size
VERY, VERY, unimportant. If I have a choice between exec size and speed, I'll
take speed every time. I would guess UNIXMODE adds quite a bit to the size
of GCC execs (I'm not sure) since it is emulating a new file system.

> - the version of zoo sources i have can easily be ported to any

> zoo 2.1!". if it is any consolation, at least 1.02 does not core
> dump when it finds this out (0.03 does, at least my port on a
> convex does).

When Yoshi added -lh5- to lha (as it is now known) he also re-wrote much of lha in assembly. Thus, no version of lha has ever been ported to Unix, so you cannot unlzh any -lh5- archives.

>also, i know of some optimizations for zoo which may not have been applied
>in the version i have (posted to comp.binaries.atari.st by steve grimm).
>i know the unix version with larger i/o buffers is significantly faster
>(at least 20% on a convex C210 with VME disks). if that is also true on
>the ST, then the small speed advantage lharc has (only on compression, that
>is) over zoo goes away. and zoo 2.1 may be even faster than lharc on
>extraction in that case.

There have been some significant optimizations to ST Zoo, though none of them change any of the Zoo code. All i/o is done with the aid of a 32K buffer (as set by __DEFAULT_BUFSIZ__). When I initially ported Zoo, it took 7:03 to compress gcc-cc1.ttp(roughly 600K) using high compression. After profiling and then 'inlining' the appropriate functions, I was able to get the compression time down to 5:36. I believe that shows some of the power of the GCC compiler.

>also note that this version of zoo appeared within days of being posted
>to alt.sources. i am sure it has not been tuned in the slightest. and i
>hope it stays that way, so we don't end up with 50 versions of zoo.

It took me about 1 hour to do my initial port of ST Zoo. Any 'tuning' I did has been added to the mainstream Zoo source.

>it would also be nice to look at each program's i/o efficiency by controlled
>tests in cluttered hard disk partitions or on virgin-formatted floppies.
>i have not done that nor do i think it is worth the effort at this point.
>also each program's handling of directory trees should be tested. zoo 2.1
>(on the ST only!) now has an improved method for doing recursive hierarchies
>(a//). the unix version still uses the "find . -print | zoo aI archive"
>method as far as i know. this is not possible with the ST without CLIs that
>support pipes. gulam (and the desktop) do not support pipes.

I don't know if I'd call the present method of 'recursive descent of directory trees' improved :-) I think enough people have twisted R. Dhesi's arm so that he will add this feature to the next version of Zoo. At least that's what he told me (I haven't seen the new code yet).

>comments??? rebuffs??? name calling???

Thanks for the initial comparison. I wouldn't mind seeing a more in-depth comparison of the archivers (including ARJ if it's ever released). It would help me address any of Zoo's shortcomings. Anyone interested in doing this??

3047. Mega II Expansion

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 23:09:23 UTC
From: fox@ENTERPRISE.NOARL.NAVY.MIL
Message-ID: <9109272309.AA23692@enterprise.noarl.navy.mil>
Source record: 228529

Sorry for the repost, but I didn't get any responses a few weeks ago...

I have a 'stock' Mega 2 which I would like to upgrade with additional
memory and an internal hard drive. Two questions:
1. Is the built in power supply and cooling fan adequate for
this?
2. Does the internal hard drive interfere with the SLM804?

I ask the second question because on a visit to Toad Computers a couple
of months ago, I was told that you couldn't use the laser printer with
Toad's internal drives. They didn't know if this was a problem with
other drives.

I need to replace the external Supra 30 drive, because it's dying for
the third time in less than three years... Since the machine only
runs on weekends, that came out to a mean-time-between-failures
of something like 300 hours!

Thanks for the help!

3048. Phantom of the Laser

Newsgroup: comp.sys.atari.st
Date: 1991-09-27 23:14:32 UTC
From: fox@ENTERPRISE.NOARL.NAVY.MIL
Message-ID: <9109272314.AA23701@enterprise.noarl.navy.mil>
Source record: 228528

Sorry for the repost, but I didn't get any responses a few weeks ago...

A friend is trying to convince me I need one of these gadgets...
do I? For the last three years, I've just left the back of the laser
printer open when I don't need it (or its heat, which we have enough
of here in Louisiana during most of the year, thank you!) So far,
nothing 'bad' seems to be happening... Is this Phantom board just
something to calm the more paranoid among us, or is it something
I should consider?

Thanks for the help!

>with 3 internal expansion slots. It is a very good computer, it is not an ST,
>but it is still a damn good machine, just like all the others.

Yes, a IIci is a good machine, what I am saying its not good ENOUGH for
2800. If you want a really nice machine for doing DTP, try a NextStation
with a 040 in it, which costs just a couple hundred bucks more.

Wow, you think a IIci is nice..this machine will knock you off your feet.

>
>Argue over something real, or hey, go outside and DO SOMETHING! (Have you
>noticed that the world is falling apart while you argue over your precious hunk

rosenkra@convex.com (William Rosenkranz) writes:

|[...] burrying GEM code in a an application
|making it "bisexual", if you will, makes it larger (obviously). bundling
|the gem user interface for like programs (all archivers pretty much do
|the same thing) in a separate shell seems like a better approach, though
|it may make installation slightly more complicated.

True. The problem I have with the archiver situation in the TOS world, though, is that so darned many of them exist. TOS versions of Arc have long been surpassed in performance by more efficient compressors. Yet a lot of the archives I see on BBS's and elsewhere are still ARC format. I find LZH situation depressing. I personally have had little luck getting a single LZH tool that would deal with the variety of LZH formats out there.

This is why I was happy to see ZOO version 2.1 appear, with its high-performance option that beats or matches LZH compression. The main reason I like zoo is for its superior directory handling and "novice" command set.

Having ARJ available will be even better. After using it under DOS, it became apparent to me that it merges all the best features of the different archivers I've used. Its compression is phenomenal (you want fast? ARJ does fast... you want tiny? you can get that too; slower, but not unreasonably so). It has a complete set of options for handling directories and for creating self-extracting archives, split-volume archives, etc. ad inf.

If the programmers porting ARJ make a version that everyone can use conveniently, we may be looking at the StuffIt of TOS archive programs. Because the compression beats the competition (and after all, that's the bottom line in archivers, no?), people will likely latch onto it. If, as an added bonus, it has a user-friendly face, more people will want to look at it. If it's the best archiver in terms of compression vs. speed tradeoffs, and flexibility in file handling, it'd sure be nice if it were also the best in terms of ease of use.

As an aside...
|also, IF atari plans on ever releasing some flavor of UNIX in the future,
|it will be in your best interest to educate users on using CLIs anyway.
|[...] i really don't see a way around CLI use in unix
|at some point (i.e. sys admin). who knows, atari might suprise us :-).
I think the Atari Unix group will do just that!

|the other problem is that i fear gem code and the application will get
|hopelessly intermingled making it impossible to port to non-GEM platforms.
|that is assuming source is even distributed.

[Good example of how to insert system-specific GUI code into a
CLI-based source distribution deleted]

|comments, ken??? could this be a new standard programming practice? :-)

You're right on that count. People porting programs like this
should be careful about how they wedge GEM features into a CLI-based
program. Whenever one modifies a source distribution, the modifications
should be as nonintrusive as practical, and there should *always* be a
way to retrieve the original, using conditional compilation or other
techniques.

Also, while it's true that programs bloat a bit when GEM features are
added, the rewards are worth the few extra K of disk space consumed.
The extra effort can make a program useful to thousands more people. As
an example, wiring a non-trivial GEM UI into MicroEMACS costs adds only
about 20K of disk space to a 100K or so program. That 20% increase in
size makes the program much, much easier to use (in my experience, and
in the experience of EMACS users, both novice and pros, on whom I
foisted the bug-ridden hack :).

Unfortunately you are absolutely right.

But on the other hand, what may happen if you don't Mfree() the memory?

Atari could launch a TOS, in which the accessory owns its Malloc'ed memory. A terrible fragmentization of the memory would be the result, because the Malloc'ed block is normally above the running main application. Every time you leave the accessory, there could be a new block of dead memory in the middle of the RAM.

Unless there is no guarantee by Atari, that accessories will _never_ _ ever_ own Malloc'ed memory, it is "less bad" to Mfree the blocks.

I must leave it to the user, that he closes all ACC's, if he uses a non AES shell (which is a rare case).

Any other opinions?

I have noticed that the system LZH201E was compiled with Torbo C 2.0,
may be there is a Problem with a C libary,? that caused ARGV to fail,
I do know its there as I have traced it..

> works the same in all TOS versions. it is used to set file timestamps.

From some Atari Notes that I have on TOS 1.4, they mention incorrect
documentation of the Fdatime GEMDOS call, thats in earlier versions of TOS ?,
could this be the problem ?.

One thing you did not test with both Archivers was full i/o, did you
not state that ZOO 2.1 has a problem with Disk i/o,?
if this is the case then none of your tests are valid.

I think that it would be far better if some one had done these test,
that was not that biased, you new of the new features in zoo 2.1, but
you did not bother to find out about any new features of LZH201X..

As far as ZOO is concerned, I find that ZOO is used on only
about 2-5% of the PD files that I get.

Also I have never made a ZOO archive, I had so many problems with eXtracting ZOO archive that I don't use it as a archiver at all, there are too many switches to understand, unless you have a Computer Science Degree, so far from what I can see only used by Unix Freeks, they like wearing key boards out..:-)..

Yeah, it was a great show. I remember the episode about the healing glove, where a 1040ST was shown pretty well. The guy who lived on a ship was working on it even, when the action was taking place on that ship.

I've seen the ST on a couple of other shows, and even on PBS once or twice.

Yes you are right, you can only use a MFM RLL drive, or take a chance
and use a normal MFM drive and format it RLL..

Also it is posible to format hard drives with a 1:1 interleave, but
this has to be forced with some format software, as the controler is
seen as a Adaptec 4070, this normaly can't do 1:1,
but this is a Atari one, and it Can..!

The Motorola 68000 series of microprocessors have an asyncronous bus system. There is no 16MHz or
32Mhz or xxMHZ bus system in the TT. As you probably know, the MC68030 can read from TT-ram in burst-modus and this is as fast as it can be. It is not limited by a "slow bus".

Zoo 2.1 defaults to extracting subdirectories. If you have an archive that
contains pathnames in the archive entries, then any of the following commands
will extract the full pathnames:
zoo x foo.zoo
zoo x// foo.zoo
zoo -extract foo.zoo
zoo -restore foo.zoo <- Atari ST version only
zoo e foo.zoo
zoo e// foo.zoo

If the version of Zoo you have doesn't follow these rules, then you must not
have the version that was posted to comp.[binaries/sources].atari.st.

In article <VPDy91w164w@ersys.edmonton.ab.ca> mforget@ersys.edmonton.ab.ca (Michel Forget) writes:
>I can't be positive about this, but I am fairly sure. Gulam uses the
>Mark Williams C Extended Argument Passing system, which is close to the
>system that ARGV uses. It *ISN'T* ARGV though, so that may be why Gulam
>crashes.

gulam _does_ use the MW scheme and it is close to the ARGV spec endorsed by atari. however, the fact that zoo worked and lharc did not means that the port of zoo was designed for use by the desktop and in shells like gulam. lharc was appearently not tested before it was released the way i did. you cannot disguise the fact that it DID crash my machine as configured. and there were not TSR/DA problems (i only use AHDI, FOLDRXXX, and a ramdisk and no DAs, not even control panel, and no funky hardware setup).

zoo was compiled with GNU C 1.40 which has a nearly-POSIX compliant library. the gnu library has been painstakingly worked on by a number of people (bammi, dale schumaker, eric smith, etc), quite a collection of ST talent. it has also been well tested in a number of environments, including gulam, desktop, bash, MiNT, etc. it may not be 100% bug free, but then neither is TOS itself. and it gets updated more often :-). part of the test was to dispell the notion that to get decent performance you _must_ code in assembler. this is just not true (in this case). the optimizer in gcc seems to work pretty well. again a tribute to 1) the FSF (stallman et al), 2) bammi's port, 3) the C language itself. in fact, i'd say that using any compiler that has a solid runtime library is infinitely preferable over using one that does not and writing your own, no matter what the possible difference in performance might be. in gcc's case, it just so happens you get both: performance and portability.

> Okami supports ARGV Parameter Passing, if you can figure it
>out. I can't read German, so it hasn't been the easiest method to
>use...:)

i do not have okami, tho i hear it is quite good. i never said gulam was the greatest thing, tho a) it has been around for a long time, b) it is widely used by CLI types like myself. the fact that lharc does not work and play well with gulam IMHO makes it problematic because of the number of people it may effect. i can't read german any more either :-(.

from this point on, i defer all comments about ARGV to experts in this matter. i am not. however, as i used the programs, within my particular environment, lharc crashed. and i clearly identified "my environment". the crash was totally unexpected as well. in fact, i lost some things in my ramdisk as a result :-(.

if i have to, i _will_ read the complete ARGV spec, the docs regarding env_style mw in gulam, and the source for crt0.c and main.c in GNU C and _become_ an expert. however, this will still not make lharc work correctly with gulam. and the timestamp issue has nothing to do with gulam anyway. changing a file's timestamp is done with the GEMDOS Fdatime() function. if i had the source to lharc, i could track this down.

>Lharc 2.01E works fairly well.

it _does_ work _fairly_ well. just not as well as zoo IMHO. and i still have not heard about its failure to get the dates correct on unpacking, no matter how many times i read its manual.

>these problems. All in all, though, Thomas Quester's programs are some
>of the best available for the ST. Especially PFX Pack and AFX Pack.

no dispute here. i _really_like_ PFX and i will even register it if thomas sends me the source so i don't have to disassemble it myself. i want the source before i use it because i want source to _any_ archiving system i might use. i figure it would take at _least_ an hour of time to disassemble it (correctly) and annotate it. it would easily be worth the $10-20 (or whatever) nominal registration fee.

>I'll check to see how well Lharc 2.01E supports ARGV, but if the author
>says it is supported it is a good bet that it is.

please do check and let us know. it might support ARGV, but it does not support ARGV in a gulam environment. it should. zoo does.

>I also read the
>article containing the test, and it did seem very biased toward ZOO. The
>writer perhaps should have read the documentation before complaining
>about the program not being able to do certain things. The actual

ok, i admit it. when i started the test, i was biased by the fact that lharc has had a bad reputation. but i _honestly_ did not know:

1) relative compression speeds
2) relative decompression speeds
3) relative archive sizes
4) bugs (tho i did suspect the timestamp problem)

and i would have posted the test results even if lharc had beat the pants off of zoo. i truly did try and be objective by choosing unbiased tests, i.e. the sorts of things i think many people use archivers to do. you can either believe this or not. that is certainly your prerogative.

further, i reported what i found. if you find bits and pieces of the report which indicate _extreme_ bias, it could just as easily be _your_ bias as well. however, the numbers (times, sizes, timestamps) do not lie nor did my dead ST after the "lharc a xxx *" test. the only possible bias could be in how i actually _used_ the programs, and the specific tests which i admitted (several times) where not exhaustive. i even complimented TQ on providing the best lharc on the ST.

i could have easily wrote a report that said:

1) compression rates are similar, within 1%
2) archive creation time is similar, within %15
3) archive extraction time is nearly identical, though zoo
was faster in one isolated instance
4) lharc could not unpack files and keep the same timestamp
as the file in the archive
5) lharc crashed the computer (and describe the circumstances)

i provided additional commentary which i thought would be percieved as reasonably fair by reasonable people. and i provided voluminous raw data by which you could draw your own conclusions, if need be. and you are certainly free to do your own (biased or unbiased) tests and report the results. even a terse report could be percieved as biased. so make up your own mind using your own tests. i even pointed out further tests which i thought were needed. i just can't see how this is _very_biased_.

i could read until my eyes fall out of my head. it still won't stop the problems i mentioned. nor will it run faster nor will it make smaller archives. if the solution to the ARGV crash it to get another shell, this is _unacceptable_. perhaps you could show me how to get around the timestamp problem and the crash problem after reading the docs. i did skim them (after the report) and found nothing to indicate a way to correct the timestamp problem. i can probably work around the ARGV thing. but that is again not the issue. the code has bugs. PERIOD. and if the source were posted, we could help TQ find these bugs and fix them.

i checked the original copyright notice from yoshi (original author of lharc). it explicitly states that if modifications to the source code are made, they MUST be distributed. even if that modification is changing C to assembler. if i wanted to be nasty, i'd say TQ has violated the terms of Yoshi's copyright by NOT providing source.

>compression rates seemed fairly even, whih is a good thing. The next
>sries of compression programs will all be trying to beat each other, so
>we might see even better compression routines. There has to be a limit
>on how good compression can be though...

yes, the compression rates _are_ similar, as are the compression times and decompression times. similar enough to abandon lharc in favor of a more versatile, less buggy zoo...

thanx for your comments.

In article <1991Sep28.132241.17704@actrix.gen.nz> Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:
>One thing you did not test with both Archivers was full i/o, did you
>not state that ZOO 2.1 has a problem with Disk i/o,?
>if this is the case then none of your tests are valid.

yes, i know this, and i mentioned this right up front. the problem with disk-based io is that it can be extremely hard to duplicate a test environment. i/o rates on nearly full partitions, especially highly fragmented ones, can be greatly different than on empty partitions. then there is also the issue of drive seek rates, interleaving, etc. a "proper" test would take this into account and further report the _EXACT_ configuration down to the size of sectors, fragmentation, etc. unfortunately, people rarely go thru this much trouble. i tried to side-step the issue by insuring at least an equal playing field. the comparison should be unbiased for the use of these programs in ramdisks. it does not, as you correctly point out, say anything about use on floppies or harddisks.

however, i suspect that zoo (the GNU C version) would be rather efficient. bill shroka (who did the zoo port) confirmed the change in buffer size (which i also applied on my unix version) which significantly improved its speed. also, the GNU C i/o routines in my experience are at least as efficient as any other C compiler i have used on the ST (alcyon and sozobon). i say "at least" since the gcc stdio is derived from dlibs (i think) which is the prefered library for sozobon as well. bill further explained that zoo was ported in about an hour. the buffer size change is one line in one file. how long did it take TQ to port lharc from C to assembler? i would suspect considerably more than an hour.

what i would suggest is that GNU C be tried on the ST on the original lharc C (only) sources. i would even except lharc if this was done in the first place way back when, before everyone and his brother got in the "let's port lharc to the ST" game.

>I think that it would be far better if some one had done these test,
>that was not that biased, you new of the new features in zoo 2.1, but
>you did not bother to find out about any new features of LZH201X..

ok. i invite you to replicate this or perform your own. i really don't think it matters who does the test. in fact, i'll even offer to do whatever test you feel is necessary, within reason. you tell me the configuration, environment, command switches, etc. you want. i can't guarantee i will have the same hardware, however. the only restriction is that i use my own choice of zoo, which i will document explicitly by sending you the source, makefiles, even the frigging compiler!

what new features? did i use lharc incorrectly? there are only so many ways to pack an archive and i insured that lharc used it's highest packing algorithm, lh5. this happens to be the default.

and still, i wish you would point out in the documentation where it shows how to unpack files from an archive and preserve the timestamp. i did not find it in my docs. nor did i find any mention of alternate methods to improve speed or packing ratio. please direct my eyes to the proper citation...

>As far as ZOO is concerned, I find that ZOO is used on only
>about 2-5% of the PD files that I get.

i, however, find it is more like 60-70%. all GNU-derived software on the ST is packed with zoo. most comp.binaries.ibm.pc stuff is packed with zoo. once again you are telling us that just because you don't need it, none of the rest of need it either.

>Also I have never made a ZOO archive, I had so many problems with
>eXtracting ZOO archive that I don't use it as a archiver at all, there
>are too many switches to understand, unless you have a Computer Science
>Degree, so far from what I can see only used by Unix Freeks, they like
>wearing key boards out..:-)..

i did invite name calling, didn't i :-)...

i have not had any problems with zoo (except porting it to a cray-2 :-). and "unix freeks" like being productive. that often means using our fingers on keyboards.

for your information, there are about as many switches with lharc as with zoo (if _you_ read the docs :-). zoo also has "novice" switches. here is a summary of common ones:

```
zoo -add archive files... add individual files to new/old arch
zoo -backup archive directory recusive add
zoo -extract archive extract all files from archive
zoo -restore archive extract recursive
zoo -list archive list files in archive
zoo -test archive test files in archive
```

is this _that_ difficult to comprehend? in fact i suspect the only ones you really need are -backup, -restore, -list, and -test for 99% of your needs. i think with little effort, i could teach my 3 year old nephew these few commands, if i could explain what an archive was to him :-). and last time i checked, he was bright, but had no CS degree :-). neither do i for that matter. the switches are _highly_ mnemonic. they are words for crissakes. this only poses a problem if you don't grok english. in that case you can resort to their equivalents:

```
zoo a archive files...
zoo a// archive directory
zoo x archive
zoo x//. archive
```

etc...

zoo has the added benefit of trying to extract files from damaged archives.
i know of no such capability with lharc, tho i am willing to learn of one.

-bill
rosenkra@convex.com
defender of the faith...

(by the way, "grok" is not a unix command :-)

Message-ID: <1991Sep28.164405.23756@noose.ecn.purdue.edu>
Source record: 228541

Hello Everyone,
Once a long time ago someone in Canada posted that he had bought "Maple"
for his ST at a school bookstore. I have never seen this program
advertised for the ST; does anyone know if it is still available?
Is it a full GEM implementation?

As I understand it, Maple is a math program like Mathematica that does
symbolic and numeric manipulations (as against something like Mathcad
which is entirely numeric).

Any comments are welcome,

Jim

>fast? ARJ does fast... you want tiny? you can get that too; slower,
>but not unreasonably so). It has a complete set of options for handling
>directories and for creating self-extracting archives, split-volume
>archives, etc. ad inf.

i, too, look forward to ARJ. i don't particulary love zoo, tho i definitly
like it more than lharc for the reasons u mentioned as well.

however, i forsee the same problem with ARJ as lharc: lot's of people
porting it, and worse, _changing_ file formats and compression schemes.
the only possible salvation would be for Atari Corp. to step up and either
do the port or sanction the port. this body here is far to democratic when
(in this case) totalitarianism is needed. i realize this poses significant
problems, however, not the least of which could be legalities.

i do have faith that in a race, if ARJ is POSIX compliant, anyone using
GNU C would win, and would _certainly_ beat a port to assembler :-).

>Because the compression beats the competition (and after all, that's
>the bottom line in archivers, no?), people will likely latch onto it.

no, it is NOT. it is portablility _and_ speed/size/etc, in that order.

i think we have a rare opportunity here: actually _plan_ the introduction
of a potentially widely used piece of publically available code. "think
of the colors...:-)".

>If, as an added bonus, it has a user-friendly face, more people will
>want to look at it. If it's the best archiver in terms of compression
>vs. speed tradeoffs, and flexibility in file handling, it'd sure be
>nice if it were also the best in terms of ease of use.

agreed.

>Also, while it's true that programs bloat a bit when GEM features are
>added, the rewards are worth the few extra K of disk space consumed.

agreed. i have no problem with GEM-izing anything as long as it is done
with care. that means it should NOT effect non-GEM use, its original
purpose in the first place.

>The extra effort can make a program useful to thousands more people. As
>an example, wiring a non-trivial GEM UI into MicroEMACS costs adds only
>about 20K of disk space to a 100K or so program. That 20% increase in
>size makes the program much, much easier to use (in my experience, and
>in the experience of EMACS users, both novice and pros, on whom I
>foisted the bug-ridden hack :).

not THIS emacs user. i rarely use the mouse in ME. i have no mouse at
work with gnuemacs. even when i did, i didn't use it. the trouble with
relying on special features is when they are not available, you can't
function. i tell this to people at work when the extole the virutes of
X terminals over my arcane vt100 clone. i casually mention a common
scenario: go to do some work at a customer site who does NOT have any
X terminals for you to use. double presure: customer watching+can't
use tools u know=much egg on face :-).

oh, and as bammi pointed out, i,too, may have made a significant error
in my code example that checks the number of args to decide which main
to use. if i said "if (argc < 1) do_gem()" i _really_ meant
"if (argc < 2) do_gem()". i would not suggest using my example anyway
since i can no longer claim expertise in GEM programming. it has been
years since i wrote GEM code, tho when i did, i wrote a LOT of it (a
60,000 line application for starters...). the idea, however, should be ok.

thanx for your comments, ken...

Hi,

Anyone on the net know when the next version (> 1.2) of Sozobon will
be released? Someone mentioned a couple of weeks ago that it was going to be
released in a couple of weeks :^) but nothing has shown up in
comp.binaries.atari.st or atari.archive.umich.edu.

Thanx for any info,

dhbutler@magnus.acs.ohio-state.edu (David Butler) writes:

>One thing I have noticed about the computer world is that there are a lot of
>real bone-heads in it, like as in thick skulls. Atari and Amiga users are the
>WORST of the lot.Get off your high-horses guys, you are arguing over a hunk of
>frigging silicone and some wires! That's right, go home, look at your ST, and
^^^^^^^^
>think about what it really is, a lump of PLASTIC and METAL, and that is all,it
>has no importance. GET A LIFE! All computers are good a different things, and
>that is all there is to it! I like them all, I use them all (although the
>consulting lab I work at during the day recently got rid of the Amigas, rats)

[..stuff deleted]

Fascinating! My ST uses SILICON ! No silicone in sight ! Silicones are a
class of compounds with the formula (R2SiO)n where R is any hydrocarbon
group. Silicones are used as water-repellents, laquers, lubricants, resins,
artificial breast augmentation etc. but they ain't semiconductors!

Anyway, this aside I believe David has missed the point. I think the original
poster was saying that you can get Mac compatability at less cost than buying
a Mac - no comment about what was *better*, just *cheaper*.

Something else I find curious - David seems to believe that arguing about
arguing about computers is inherently better than merely arguing about
computers. I think it is even more futile!

David also says that different computers are good for different things. Does
anybody know what Intel architecture machines are good for (other than running
DOS software, which is rather a circular argument) ? I mean in a computing
senses - "As a doorstop" is not quite the type of answer I'm looking for.

>this is actually a good idea IMHO.

Since I am not a very big fan of GEM, you can be sure that I will think this matter over very thoroughly. I won't add any internal GEM interface just to be trendy, but there is a large demand for one (on GEnie). Perhaps when Rainer's Arcgshell is updated, or when Steve Yelvington completes (if it's not already completed) ZOOSHELL, this demand will subside.

>i just get shivers down my spine when i think about proposals to muck

When R. Dhesi contacted me about incorporating my version of Zoo into the "mainstream" version he seemed very open-minded. Simply stated, he sends me the new version of the source, I make it work on the Atari and send it back to him. He then releases the source on one of the sources newsgroups. As long as any GEM code lives within atari.c, I don't forsee any problems but I would definately check with Rahul first.

The person who mentioned it was Steve Yelvington. The place where he receives his E-Mail is *VERY* hard to reach. Every message I send takes about five days for him to receive it. First it gets bounced back with the message "host unknown" and then he usually gets it a few days later. The few times we have been able to get mail to each other, he mentioned that the author (Ian Lepore (sp?)) decided that he was going to make a few more modifications to it since he was going to release a new version anyway. A version (that has a few problems) is available from MAST for $4 US. I sent away for it, but haven't gotten a reply yet. I'm not sure if it will take 4-6 weeks like a mail-order service or if they handle the packages within three days (like magazine). This Monday, the letter will have been in their hands for 14 days. I sent it Special Delivery (3 days guaranteed) so I know that it should have arrived two weeks ago counting from this coming Monday.

Anyway, I hope this helps to answer your question. The version from MAST is 1.6xx.

rosenkra@convex.com (William Rosenkranz) writes:

[a very long meesage which the system reports as too long to follow-up to. In it, he states several points which I will paraphrase.]

1. Thomas Quester may have violated the porting agreement designed by the original author of Lharc by not supplying source code.

You really want that code, don't you? Two points come to mind, though. The first is to question whether or not he made a new agreement with the author of Lharc. He might have, you know. The second is to wonder whether or not changing the language is the same as changing the code. The end result is the same, isn't it? The porting agreement may have meant that changes to the -compression- code or the changing of the -functions- of Lharc must be distributed. These two points are only speculation, though.

2. I myself may have been biased in suggesting that your tests were biased.

This is possible, but not likely. I really don't care much one way or the other about which is better. I use Lharc right now because it is the best available. If I thought ZOO was better, I wouldn't hesitate to switch. Zip also gives about the same compression and the same speed as Lharc and Zoo. So far, Lharc has been the most reliable program for the ST in the compression area. It also has a lot of really nice features.

3. Lharc may have a problem with time-stamps.

This I doubt. I have been using Lharc for a while now, and I have never experienced the problem. I have TOS 1.4, as did the other user who mentioned he had no problems. I think it might be your version of TOS. While I think Lharc should prabably work with the other TOS systems for completeness, but I won't carp about it. TOS 1.2 and 1.0 should be fazed out of use anyway.

4. Assembly code doesn't provide a large speed improvement.

This is normal. C is very close to assembly, so the speed improvement wouldn't be that big. On the other hand, it is a great deal faster than Pascal or Modula-2 or Basic.

I hope I have managed to address some of your major points.

FCC testing IS a real problem. My father in-law is getting into the
business of testing computers for the FCC. Why? Because there are only
4 other businesses who do so. He said that when the FCC approves his
company (the hard part), he will instantly have $15,000 in his pocket.

>rosenkra@convex.com (William Rosenkranz) writes:
>You really want that code, don't you? Two points come to mind, though.

note: whenever i mention "unix", substitue VMS or CMS or anything else.
i just happen to use unix. others may use something else (non-TOS).

yes, i _really_ want the source to ANY archiver i use. just to make sure
that 10 years from now, when i have a non-atari system, i can always get at
my 100's of MB of files (by a recompile of the program on the new system).
is that _so_ tough for you to swallow? i have a HUGE investment in data,
don't you? and do you think the 8mhz 68k will live forever? i would not even
bet that half the computer companies in business today (eg atari) will be in
5 years. who knows? why take a chance when such a trivial solution exists.
unix lharc will NOT extract lh5 archives. unless you have one that does.
if so PLEASE POST IT!!!!!!! from what i understand, lh5 is only implemented
in assembler even on the PC since it was so slow there. a really stupid
thing to do, IMHO since it makes it non-portable. if anything, it should
have been both (c and asm).

>The first is to question whether or not he made a new agreement with the
>author of Lharc. He might have, you know. The second is to wonder

ok, i will contact yoshi myself and find this out. what do you want me
to do: have yoshi _force_ the source to be released? i am asking
politely.

>whether or not changing the language is the same as changing the code.

changing the code is changing the code. edit 1 line and i figure that
is a change. it is not the same as before. here we have _huge_ sections
of the code changed. there is no doubt that the code _has_ changed.

>the other about which is better. I use Lharc right now because it is the
>best available. If I thought ZOO was better, I wouldn't hesitate to

good for you. use lharc all u want. what i am arguing about is a "standard"
for posts and files uploaded to public archives on the net. what you do at
home or wherever is none of my (or anyone elses) business. and i don't care
what happens on BBS's either. only atari.archive and panarthea (or whatever
the comp.{binaries,sources}.atari.st archive calls itself these days).
everything else is of no concern to me, tho it might be to others.

>switch. Zip also gives about the same compression and the same speed as
>Lharc and Zoo. So far, Lharc has been the most reliable program for the

hardly. lharc on the ST is unreliable. read my post more carefully.

>3. Lharc may have a problem with time-stamps.
>
>This I doubt. I have been using Lharc for a while now, and I have never
>experienced the problem. I have TOS 1.4, as did the other user who

READ MY POST. i showed you the problem, unless you think i am lying to you. it does not work on my system, the biggest ST atari makes (mega 4 with 80 MB of atari harddisks). zoo does. i preseted unedited results of directory listings after extraction. the date was wrong. lharc has a bug making it useless for people needing it to be accurate. PERIOD.
that list of people includes any programmer who uses make, RCS, or similar tools.

>mentioned he had no problems. I think it might be your version of TOS.

so what. it should work on ALL TOS versions. otherwise it is hardly universal, or _reliable_ as you claim. it is not as i _showed_.

>While I think Lharc should prabably work with the other TOS systems for
>completeness, but I won't carp about it. TOS 1.2 and 1.0 should be fazed
>out of use anyway.

there are LOTS of people with TOS < 1.4. many people who write s/w for a living MUST maintain test systems just to make sure their software runs on all revs. your solution is to change the operating system to suit a buggy program. hardly what i would call rational. if i had the source (there he goes again :-) i could fix it and you would not here a peep out of me!

>4. Assembly code doesn't provide a large speed improvement.
>
>This is normal. C is very close to assembly, so the speed improvement

i was responding to another who insisted that lharc was written in asm for speed which i demonstrated is not inherently needed, unless of course you are actually striving for anit-portability :-).

>I hope I have managed to address some of your major points.

yes, however i think i still win the argument :-).

and i really fail to see WHY the test itself was biased. _i_ might be, but how is the _test_ biased? i tried for equal footings by eliminating a potentially huge bias with hard disk (i _could_ have done the lharc test in a nearly full, highly fragmented partition on a slower disk and the zoo in a high speed empty partition, saying that "i ran both on a hard disk"). what actually was biased in the results? that i happened to pick a test which CRASHED MY MACHINE? that i happened to pick a test THAT PRODUCED INCORRECT TIMESTAMPS? that i happened to pick tests THAT SHOW ZOO IS AS FAST AND AS EFFICIENT? if you read the same thing in a trade rag, you would thing it was unbiased, i suspect. maybe i should have submitted the article anonymously :-). i tried to be EXTREMELY detailed in my reporting. i do benchmarking for a living.

maybe less IS more.

when you accuse the test of being biased, be specific. name calling ("oh, rosenkranz posted that, he is biased"), tho i _did_ invite it, is useless...

3075. Spectrum spazz on TOS 1.62/STe?

Newsgroup: comp.sys.atari.st
Date: 1991-09-29 05:07:03 UTC
From: rjung@aludra.usc.edu
Message-ID: <20104@chaph.usc.edu>
Source record: 228549

Hi. I just recently got myself a 520STe with TOS 1.62 installed. I notice, though, that whenever I try to load in Spectrum 512 pictures, they get columns of black or white pixels running at random (and not aesthetically pleasing) places along the image.

I imagine that this is due to some inconsistency with the Spectrum picture display routine and TOS 1.62/the 4096 STe palette. Does anyone know of a patch or solution for this problem that I can use? Any information would be appreciated.

3078. digitzing video for DTP

Newsgroup: comp.sys.atari.st
Date: 1991-09-29 09:38:40 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <43372@ucbvax.BERKELEY.EDU>

NetQuestion...

I would like to digitize video for use in DTP type applications. How should I go about this?

Background and conditions:

I'm using an ST as a Mac via Spectre GCR and as a regular ST. I am about to look into purchasing a camcorder from a friend. I see this as a prime opportunity to start using digitized graphics in my documents. However, I am also in the process of phasing out my ST.

"Dumping the ST!?!?" Well, sort of. Right now, I have a 520ST, 4MB RAM (JRI SIMM board), GCR, modem, hard drive (Syquest coming soon), printer, and probably a DEKA real soon. I would like to "upgrade" to a MAC by moving all the peripherals to a Mac and using the ST for something else (maybe a BBS or something). The ST would remain a working system, but I would probably stop buying things for it. At this point, I would like to stop purchasing ST specific products. I realize this may not be possible with an ST digitizer.

What I would like to do is digitize video, use the graphic in other programs or documents, and print the document out. I would like to import the graphic into Mac Word 4.0, Superpaint 2, and HyperCard on the Mac; WordFlair II and Calamus on the ST. I don't care if the digitizer does only black and white, as long as I can get a good image. More than 16 gray shades would be nice. I would like it if it did not take up the cartridge slot. The software MUST work with a mono monitor.

What digitizer is best for me, and what additional software would I need?

3079. GEM vs. strict CLI

Newsgroup: comp.sys.atari.st
Date: 1991-09-29 10:07:03 UTC
From: kawakami@earthquake.Berkeley.EDU
Message-ID: <43373@ucbvax.BERKELEY.EDU>
Source record: 228558

I don't understand what the real problem is of writing archivers (or any other traditional utilities) with GEM encoded as part of the interface. What the programmer should do is not become GEM specific, but design a minimal visual interface. I think you can assume a simple model like this:

* An event driven graphical user interface. Assume no icons, just text and "curses"-like screen handling with GEM-like windows (the windows send event messages to the application.)

* The "brains" of the utility acts a lot like the CLI version, except that it returns results to other parts of the program, not to the user.

For example, an archiver in GUI interactive mode should work like StuffIt on the Mac. You can uncompress files one at a time or many at a time, but you don't have to type any file names. It works the same the other way.

If we assume a minimal textual visual interface, a-la PC programs, then porting on different platforms would not be a problem.

It's the 1990's. The graphical least common denominator is the PC compatible. There is no need to exclude user interfaces from utilities.

I have dabbled in STOS, and have created about 2-3 games. Although, I must say, they were not the GREATEST of games, I know of at least 30 people on a local bulletin board that loved them!

In one, you get to get your revenge on the "Energizer Bunny" and shoot him as he scrolls back and forth across the screen.

I could uuencode the game and source for you, then send it your way if you would like. Altough, at 1200 bds. it might take some time to finish the long transfer to just MY host.

Write me back! I also love to hear from STOS users.

>Unforutnately, just because Atari sells a product in Europe does
>not mean that it will ever be sold here in the USA.

You probably wouldn't want a STacy anyway (except as a desktop machine).
ST book is a different story, it looks like gear worth marketing.

>For example, just how many different models of IBM PC clones
>did Atari sell in Europe (or even Canada)?

>Atari has NEVER sold a PC clone here in the USA.

That is then one thing which the US didn't have to suffer. What on earth
were Atari doing boxing up PC clones anyway? I was in Copenhagen recently
and found an Atari store with a window full of PC clones and a major display
of "Atari, power without the price". There were also a few PC's from other
manufacturers on display but hardly an ST to be seen. I think I saw a 1040
somewhere in the depths of the shop, but maybe my memory is playing up
(you know, inventing things in order to soften the impact of the raw truth).

"Atari PC" has probably done far more to damage Atari's image than any amount
of vaporware. When the ST first came out it was truly innovative, The ST book
shows some fresh innovation. It looks like Atari are returning from a prolonged
psychotic episode, back towards the cutting edge of computer technology. Maybe
it'll even happen.

> Well, Neodesk's clipboard really seems to be a variable size RAMdisk. You

The gemini clipboard is actually the GEM clipboard it is a standard
facility to interchange files with programs.
It can be accessed by programs using the scrap_... functions of AES

The Neodesk clipboard is a badly named function of neodesk that has no
relation with the function of the gemini clipboard.

The GEM clipboard can still be used under Neodesk ofcourse, use of this
clipboard is made very easy by the acc named 'CLIPBRD' it is PD I think.
Note that all GEM programs should support the clipboard but most don't
and if they do they mostly do it incorrect (like 1stWP)

>wearing key boards out..:-)..

This is one of the greatest misconceptions about Zoo. In it's most basic operation, Zoo is as easy to use as ARC or LHarc. Let's see, if I wanted to extract an archive made by one of the mentioned archivers I would issue the following commands:

ARC: arc x foo.arc
LHarc: lharc x foo.lzh
ZOO: zoo x foo.zoo

I don't see the problem. Zoo doesn't become complicated until you start trying to do more complex things with it. Any beginner that's familiar with another archiver should be able to atleast extract from a zoo archive.

It's called Xlharc :-) I used the Unix V0.03 sources for my original port of LHarc 1.01 (later renamed Xlharc). When I first released my LHarc, the only other ones available were LHarc .51 (not a TRUE LHarc) and FASTLZH (also possibly LHA, I forget). My LHarc (using GNU C) was always the fastest until Questor's later versions of LZHxxx started showing up in the States. By that time, there were so many incompatible versions of LHarc for the ST, I had given up hope for LHarc. That's when I contacted R. Dhesi about all of the rumors floating around about a "new" zoo.

Who wants to see the DKB ray tracer for the Atari? I already have
the command-line version of it done for the TT, and am now working on
the GEM interface. Yes, it will take arg's, even if GEM. GTP for all
you Newdesk users out there. Anybody care?
If you do care, tell me how to force eight zillion printf's into a
window. I don't relish grepping all the printf's and changing them all
to v_text calls. Would FDup/FForce work? I can't see how.
Another point: Although it would be a HUGE accessory, making it an
accessory would really be ideal, since it's sludge even on a 32MHz machine,
and who wants to tie up their hardware for that long? Thought, comments,
HINTS, etc.? Email, don't noise the net. Flames to /dev/null. :-)

>rumors dispelled: using assembly language offers huge speed advantages
> over C in the problem domain of file archivers.

LHarc is only partly written in assembly-language. Some parts
of the coder itself are in C. It only is a long hand hard way
to produce a higly optimzied version of about 1000 lines of
nearly undocumented source. The rest of the coder and decoder
will be written in assembly language some times later. It took
some version to make 1.13 four times faster.

>i tried:
>
> lharc a lll *
>
>and my system crashed! lharc does NOT handle extended args. and what's more
>it crashed my system! i did not want to reboot again so i did not test to

It does handle the ARGV, but only up to 200 filenames. I bed
you to retype your command, maybe someting went wrong earlier.

> - nitpicking: zoo lists files one per line. it is easier to grep
> things out for more specialized uses (like making lists of all
> .c files with their statistics).

Why not use lharc l archiv?

> - zoo 2.1 can extract files from ANY zoo archive of equal or
> lesser version. older versions of zoo can list any zoo archive
> even if made with a newer version. if a newer version is needed
> to extract files, the older zoo tells you what version you need.

So Lharc does. It will not say the version number, but give a
message "unknown method". Though there are some versions of
LHarc availbe without this test (for example unlzh).

>i note that the speed difference in both test cases is 11 seconds during
>archive creation. it might be possible that this is a constant. if so, then
>doubling the amount of work will lower the net speed advantage to under 10%.

This is not a constant. Zoo and LHarc will become VERRY slow,
if you, for example, compress dictionarys (sorted lists of
words). This will resault in degenerate trees and much more
substrings to be compared. source-codes compress relativly fast,
because much of it constis of only a few keywords.

> zoo 2.1(on the ST only!) now has an improved method for doing recursive
> hierarchies (a//).

This is called a -r on lharc.

3089. Re: lharc 2.01e vs zoo 2.1: some tests

In <1991Sep26.064525.15427@convex.com>, William Rosenkranz writes:

Hi William,
at first, thanks for test. Very good work. Since I'm an Lharc fan, I was
very confused about the bugs reported by you (archive time not correct,
no ARGV support, no UNIXMODE). So I tested these things on my machine (Mega
ST 2, German TOS 1.04, Gemini 1.21).

>test platform is mega4 (4 MB) 8 Mhz, TOS 1.2, using gulam CLI. environment
Well, nothing against you personally, but TOS 1.2 (or, in Atari's new
spelling, TOS 1.02) is an OS from stoneage, TOS 1.04 is the actual OS.
Needless to say that this will last for only more month, since a German
company will start to sell TOS 2.05 for a normal ST at that time.

>it also looks like zoo may support
>UNIXMODE tho i don't use it myself. UNIXMODE allows configuration so that
>forward slashes "/" can be used in file paths as well as backslash "\".
>lharc does not appear to support this either.
Sorry, that's wrong. This can be obtained by using the "-s" switch

>HOWEVER, the dates and times of the extracted files were NOT correct. they
were the current date and time NOT the times in the archive:
I tried this on my machine. No such thing. I compressed a file, the time
stored within the archive was the same as the files' time. After extracting
that file from the archive (to a different directory, of course), the
extracted files' time was the same as the time of the source file...
Perhaps it's TOS 1.02???

>i made a dummy directory with enough files so that the command line length
>would be longer than 125 chars (which is what Pexec normally can handle).

[some stuff deleted]
>and my system crashed! lharc does NOT handle extended args. and what's more
>it crashed my system! i did not want to reboot again so i did not test to
>see if it handles wildcards itself. this is TOTALLY unacceptable.

mw? Jesus Christ! Mark William's method for passing extended arguments is
not, I repeat, NOT correct. LHarc (and Gemini) both use the official
method (called ARGV). Yes, you may not believe it, but Atari has documented
this method. This (and nothing else) is the standard....
Mark William's are "cooking their own soup", as we Germans say it.

With Gemini (and ARGV support turned ON), I changed into a news directory
(63 files, filenames 4 characters long, the total commandline length was

6 (for "a test") plus 63*5 (for 63 filenames of 4 characters plus 63 spaces),
or totally 321 characters) and did

lha a test *

and Lharc packed those files into an archive. Absolutely no problems!
(By the way, LHarc can also handle wildcards itself).

> - nitpicking: zoo lists files one per line. it is easier to grep
> things out for more specialized uses (like making lists of all
> .c files with their statistics).
What about using "l" for list instead of "v" for verbose listing? When
doing verbose listings, LHArc will displays full pathnames if there are
any included within the archive. That's the reason why it needs two lines.
When using the "l" command, output will look like this:

LHarc 2.01e (c)Yoshi, Quester, 1988-91.(Assemblerversion vom 02.09.1991)

Inhalt von : 'FF110.LZH'

Name Original Gepackt Rate Datum Zeit Attr Typ CRC

(Yes, it's the german version)

> - there is one version of zoo 2.1 (that i know of) for ST, unix,
> and PC. i stopped counting the versions of lharc for the ST
> alone at about 6 or 8. there is only one author of zoo.
How many LHarc versions do you need? I came a lot of lharced files,
created by almost every lharc ever programmed on this planet (including
the unix and amiga lharc). I start LHArc 2.01e, and it decompresses them.

> zoo 2.1 will also (by default) make archives which older versions
> of zoo will extract. you have to ask for the high compression

Every tried Lharc's "-o" switch?

>i confess that i did not read the docs for lharc. as far as i know the
>questor version docs have always been in german up until 2.01e which i
>just got within the past 2 weeks.
To be more precise, you haven't read any LHArc doc's at all. Is this correct?

>nothingnew to learn. i already knew how to use zoo since i have used
>it for at least 2+ years.
Hmm, so you've read the zoo docs, did you? Well, that's not fair. If I do
get any new software, reading docs the first thing to do. (If you drive
a car for the first time without having a single driver's lession and no
experienced driver besides you, is it the car's fault if you have an
accident?)

> - the size of the executables is significantly different. about 2x

> zoo is about 53k and lharc is about 28k. the difference is not
> that significant in a 16 MB partition. what i do find fascinating
> is that the executable for lharc is itself an archive! this is
> a really super hack. incidently pfxpak was written by the very
> same thomas questor who provides the lharc under scrutiny.
If you had read only the README file, you would have found that you could
treat the executable as a normal archive (lharc.ttp x lharc.ttp) and thereby
extract the "real" LHAarc (uncompressed length 40k, pfxpacked again 28 K)
and the docs.

My conclusion from your test and my experiences with all kinds of archivers:

1.) There is no significant difference in archive sizes when comparing
zoo 2.1 and LHArc 2.01e. STZIP 0.9 beta falls out of the comparision since
it can't compress big files in this version. Let's wait for ZIP 1.0..
At that time, look out for ARC 7.0 which is available for MS-DOS right now.
I hope somebody will do the porting real soon...

And I think size is the most important point. Time doesn't matter at all
when sending files through phone lines. (De)Compression is done offline and
doesn't cost my money, so I don't care that much about the time used.

2.) The often stated LHArc fiasco or chaos is over, thank godness. LHArc
2.01e was able to handle all LHarc archives I ever got (and being res-
ponsible for a BBS with a large filebase I do get a lot of archives). And
LHArc able to create archives for most other LHArcs. All you got to do is
read the documentation <grin> and use its possibilities....

3.) Porting LHArc to Unix is not the big problem one could believe when
reading your article. Sources for the old format (used in the 0.xx and 1.xx)
version are widely available, the sources for the new format (created by
2.xx) can also be found. Check out for the sources of Amiga's AR. This is
an LHArc using the new format. (I don't know why they called it AR,
perhaps they are a bit stupid?? ;-) If you can't get them, feel free to ask
me.

> 1. Is the built in power supply and cooling fan adequate for
> this?

A positive "maybe". Some ST power supplies are right on the money, and any additional drain will result in weird crashes. ST's were not designed with internal HD's in mind. I bought a great external from D&P Computer Supply. ICD Advantage host adaptor, 85mb Seagate SCSI drive, nice enclosure which has the mount (and the cables) for a second device, lit power button, removable power cord, etc all for $574. I think the price has gone down to $539. I am very pleased with this drive. Quality and phone support were superb. I highly recommend the ICD host adaptor in any drive you buy. Their software is much better than Atari's, and is reportedly better than BMS's. The D&P number is 1-800-535-4290.

> 2. Does the internal hard drive interfere with the SLM804?

Very possibly. My disk (actually the ICD host adaptor) has a "pass thru" port on it which one would use with the Atari laser. I am not sure how this could be implemented on an internal unit (by the way, ICD makes the internal host adaptor used by Toad and others).

>
>I ask the second question because on a visit to Toad Computers a couple
>of months ago, I was told that you couldn't use the laser printer with
>Toad's internal drives. They didn't know if this was a problem with
>other drives.

I have compared my unit to a Toad, and my enclosure was made better. However, Toad seems to be offering two different enclosures now (perhaps they are using this one :-).

>
>I need to replace the external Supra 30 drive, because it's dying for
>the third time in less than three years... Since the machine only
>runs on weekends, that came out to a mean-time-between-failures
>of something like 300 hours!
>

You might want to consider purchasing a new SCSI unit and ICD host and putting them into your Supra case (new cables also, of course). Get an electrician to check the power supply (to make sure it is not the culprit). This would basically replace everything except the case/power supply, so this should fix the problem. The ICD is much better than the Supra host adaptor, both hardware and software.

>Thanks for the help!

You are welcome.

The above is IMHO, I am not connected with Toad, D&P, Supra, etc in any way.

If by "broker" you mean stock broker, I suggest you try to find a copy of
Ishgar Portfolio. It was made by Batteries Included (now out of business),
and received good reviews. I have seen it in the bargin bin for as little
as $20. I am not sure if it has this specific feature, but it is the only
commercial stock package I have heard of for the ST.

3092. Mono monitor fix?

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 05:24:00 UTC
From: boyd@bind.cs.fsu.edu
Message-ID: <1991Sep30.012400.9409@mailer.cc.fsu.edu>
Source record: 228570
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My mono monitor is acting up. When there is little "white stuff" on the screen, it starts to fade until almost black. If more stuff is drawn to the screen, it brightens up. This sound familiar to anyone? Any ideas on what could be going bad?

Any body want to make me a bid on the Atari st TOS 1.4 (6 chip rom set)

I paid $ 150.00 Australian for them! (shock yes $ 150)

But dont expect anytheing like that for them!

Make me an offer!

I prefer to stick with the TOS 1.2 as i have a second machine which i am always changing disks with. ((AND STRANGE THINGS HAPPEN WITH THE 1.4 TOS FORMATTED DISKS)

A couple of months ago a doc file on 'atari viruses' was on
ftp 141.211.164.8!

I downloaded it and believe there to be previous docs on the atari
viruses called:

ATARIVIR.A80
ATARIVIR.690

These were by the same authour

Profes. Dr Klaus Brunnstein
Simone Fisher
VIRUS TEST CENTRE
Facualty fo Informatics
GERMANY (UNIVERSITY OF HAMBURG)

Does anybody know where i can get hold of these other doc files or how
i can get E-mail to Brunnstein@rz.Informatik.Uni-Hamburg.dbp.de
from "minyos " in Melbourne Australia?

These doc files were very well done* 10/10
Very impressive

Many thanks in Advance

Richard Clarkson

>need to Pexec() from inside an accessory, and not crash the ST...

If I'm wrong about any of this may Allan Pratt or Ken Badertscher correct me
(gently :-).

I think the best way to write such a screen saver would be for the saver
modules not to be proper programs as such but loaded by the saver accessory
in much the same way as accessories are loaded by the desktop. This get's
round any Pexec problems. The saver should malloc some memory for the module,
load it in and relocate it. Now before you all start shouting "Hey acc's
shouldn't malloc memory" ley me say this: Any memory that an acc mallocs
belongs to the current process right? Right! So the problems come when the
current process terminates. The desktop program never terminates so modules
should only be loaded when your at the desktop. How do we know we're at the
desktop? By using the current process ID. If you save it when you start up
your accessory then you have the desktop process ID. Before trying to load
a module, check the current process ID and if it's the same then go ahead
else put up an alert box "Saver Modules only loadable from desktop".

The modules should have some way of being identified by the saver.
eg.
```
BRA.S start
DC.L 'SAVER',0
start:
```

The accessory can look past the branch for the magic word 'SAVER'.
Alternatively the modules could have a special saver header like CPX's have.

Whadaya think?

```

3098. Re: lharc 2.01e vs zoo 2.1: some tests

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 10:27:05 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Sep30.102705.2225@actrix.gen.nz>
Source record: 228574

This is some of the Atari info on ARGV for you, this was posted some time back by Atari..

You forgot to mention that the Date problem was so far only found on your machine, but I have not had any problems with my TOS 1.4..

Now part of the Atari Posting, with the differences with ARGV and Mark Williams..

A Final Note

This specification was formulated with careful deliberation, and with input from several companies and developers who have created development tools for GEMDOS. The Mark Williams extended argument passing scheme was the main influence for this specification, because it has been in use, and supported by Mark Williams and other companies for several years. This specification is very similar to the Mark Williams scheme, with the following important exceptions:

1) Under the specification, the arguments after the ARGV environment variable may be validated by checking the command tail length byte. The Mark Williams execve() library function uses the command tail length byte as a telltale, but it is not checked by the crts0 startup code. This validation is important for the reasons mentioned in the Rationale section above.

2) The specification allows the ARGV environment variable to take on any value. Mark Williams uses the value of ARGV as an iovector, which is described in the Mark Williams documentation. The iovector should no longer be needed, as its primary purpose was to simplify the MWC implementation of the C library function isatty().

3) Some versions of the MWC startup code do not require the ARGV= to have an `='. Because ARGV is an actual environment variable in the specification, the equals character is required.

This part is thanks to Atari..

> >*** Roger W. Sheppard * Roger.Sheppard@bbs.actrix.gen.nz ***
> ---
> Bill Shroka

Bill I only use a Gem shell, the one that I was using was Arcgshl 3.5,
but was not getting very good results, error messages that I could not
work out, I then found a copy of Zoo Boy, this I found was a lot better,
but I still get the odd problem..

My Archives are not that simple, thay have lots of Directories/Folders,
and my Base Directory is not the root, this is because I do convert a lot
of Arc Files to upload to BBS's..

I have never found good doc's for the old Zoo 2.01 or Arcgshl 3.5,
Good Doc's would help a great deal with both of these programs,
Ie, with shown examples..

Note: I am a User Not a Programer, this is in reference to a resent
Atari Quote..

-> I'm sure glad that I don't live in USA.... ;-) but:

- I'm from Finland (as you may notice) and atari sucks here too but, mail order works !!!
YES I BOUGHT MY TT030/8 mail order from germany and it was all costs included about 20% cheper for me than buy it from the former Finnish atari dealer...
and I got monitor (ptc xxxx) with it, with the same price....

-so I'm more saticified WITHOUT a local dealer since now I can do business with germany directly... (the official atari-finland dealer is out of business)
--> if they weren't many software houses wouldn't sell things from germany, they'd just tell you to go to the "official atari finland importeur/dealer"
...
so: -let's hope for the best: no "official" importeurs with protected prices !!
...
Jolly Roger up for everyone !!!

I'm amazed that Atari isn't more interested in making such a board itself.
Without it, no serious MIDI people or Spectre GCR users will buy one.

Naturally, I'm more interested in it for my music peripherals (C-Lab SMPTE/
Expander box), but I'd think that the Spectre market would be of interest to
Atari, since an ST Book with GCR looks to be over $1000 less than the
competing Mac portable.

News on GNU s/w @ A.A.

Firstly:
========
++jrb has released update13 for the GNU suite on A.A. GNU hunters will
find the file update13.zoo (requiring zoo 2.1 for unarchival) in the A.A.
directories:

~ftp/atari/gnustuff/tos/updates & ~ftp/atari/newtitems

++jrb has also indicated the imminent despatch to A.A. of a cart tape of his
collection of GNU s/w. When the tape has been transferred to A.A. and the s/w
made available, there will be a general announcement here (c.s.a.st*).

Secondly:
=========
Ghostscript 2.3 binaries (freshly uploaded) are available on A.A. The filename
is gs23b.zoo and appears in the following A.A. directories:

~ftp/atari/gnustuff/ghscrpt & ~ftp/atari/newitems

i am positive i mentioned that i had conducted the test under TOS 1.2
on my mega4. i, of course, can't run on anybody else's system.

i am glad it functions properly on TOS 1.4. however, that is still no
excuse for it NOT functioning properly under 1.2 (or 1.0). i wonder just
how this error crept in. all things being equal, then Fdatime must
have changed between 1.2 and 1.4. zoo works both ways.

>Now part of the Atari Posting, with the differences with ARGV and
>Mark Williams..
[info deleted for brevity :-)]

thanx, roger. i am pretty sure i have this info already, however this is
a good refresher. i suggest you pass it on to TQ since he has the problem,
not me :-). again, zoo (and GNU) has no problem here, as i demonstrated,
at least under my environment...

3105. .IMG to .BMP/.PCX convertor?

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 13:31:25 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <1991Sep30.133125.2980@syma.sussex.ac.uk>
Source record: 228389
Cross-posted to: comp.sys.atari.st,comp.windows.ms

In our research unit we have a mixture of Atari STs and PC/clones. We have a scanner connected to an ST which outputs files in its own format, but which comes with software to convert this to .IMG format. PC users, too, like to use the scanner occasionally, and there are some programs (e.g. Ventura Publisher, WordPerfect) which can handle .IMG files easily.

However, many users now have Windows-based software, and would like to import scanned files into programs like Word for Windows or Windows Paintbrush. What are the best programs (either ST or PC based) for converting files from .IMG to .BMP or .PCX? An alternative would be to use a 'half-way-house' format such as .GIF, as we already have a .GIF to .PCX convertor. Are there any .IMG to .GIF convertors?

It would be nice if any programs suggested were available from either cica or atari.archive, but I'd be keen to get recommendations of programs from any source.

Thanks,

Graham

3106. Help & Hints on setting up GCR please.

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 14:19:29 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Sep30.141929.2027@newcastle.ac.uk>
Source record: 228470

I have just ordered a Spectra GCR cartridge and am after any information or insights anyone can give. I will mainly be using the system for writing documents using MS Word. (I assume this will work?). Some of the questions I have are:

1) What Version of the Mac system software is recomended and why.

2) What inits etc. do you recomend.

3) What about printout to an Epson FX printer (Normally I will save the file as Postcript and print on a laser so quality is not an important factor.)

4) What other applications work well with GCR. Particually a Object Orientated drawing package like EasyDraw on the ST.

5) Since I am happy with my ST setup I would like to minimise the amount of time that I have to resort to the GCR so is there any pogram that can write MS Word compatible files? Or is there a converter for say Thats Write To MS Word?

I am thinking of buying a new ST Wordprocessor (I currently use First Word) what do you recommend bearing in mind that I would like it to be MS Word compatible.

I am aware of MS Write but this program is a bit buggy and does not even have a spell cheacker. (As I think you can see I realy need one.)

6) How do you recomend that I go about backing up my Mac partition.

7) Any other hints or horror stories you have to offer.

Many Thanks.

Dave Halliday.

>Stig Vidar Hovland - stigvi@lise.unit.no

Is this true? I admit to confusion, everyone has been saying (including Dave Small, who knows such things), that the TT is a 32mhz chip in a 16mhz archetecture (spelling?), with a cache. Much like AdSpeed (which I have, and which works well), it will run any instructions that fit in this cache at 32mhz, but larger code will run at 16mhz (this is why AdSpeed is faster with some applications, generally ones that seem well written, than it is with programs written with cumbersome code). Has this changed? It would certainly be good news if it had!

-David Butler-

-I still think the world is falling apart-

(for example, have you noticed that the US, bastion of freedom, is about to take reproductive choice away from women? Don't think it will happen?-Well, just watch out, it may be closer than you think.) Oh, by the way, I don't just talk, I'm politically active, you should be too (can you spell apathy? I probably can't.)

Actually, I far prefer to argue about whether or not we are even arguing about arguing about computers! (this could go a lloonngg way). I have heard that Corell Draw is fantastic (and seen good stuff done in it). In industry DOS machines are indespensible. Really, can't we think about something better to argue about? Maybe we should ask each other "Is the sky really blue?" A good (a GREAT) rule of thumb is: "You can't, and should not try, to define another person's Objective Reality". What this means is, what's best for you aint necessarilly best for everyone else (anti-choice people, listen up!). I think the whole thing is a moot point, computers just don't have the emotional value (at least to me) to be worth being loyal to, and certaintly not fanatical about. Of course, I do have a totally illogical (It's life Jim, but not as we know it, not as we know it...) passion for Volskwagon Bugs (got a great '68!), so I guess we all must have our petty passions of one sort or another. But why argue about them (It is much more fun, or course, to argue about arguing about arguing about them, after all...)

-David Butler-

-I still think the world is falling apart-

(for example, have you tried to buy a good stapler, hole punch, or can opener recently? It can't be done, they all fall apart in months! Right next door on OSU campus, there is a brand new bookstore (about 3 years old now), with a beautiful set of three revolving doors, which HAVE NEVER WORKED PROPERLY). Revolving doors made in 1920 still work fine, so do 1950 staplers, hole punches and can openers..... I think it is a government plot....)

3112. Railroad Tycoon Needs File

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 15:44:38 UTC
From: seattle@triton.unm.edu
Message-ID: <fqqchjm@lynx.unm.edu>
Source record: 228592

I just recieved Railroad Tycoon from Sideline Software (Friday to be exact).

Problem. The install program choked when it couldn't find the file named COLOUR.LBM. I talked to Sideline (They're not at fault in anyway) and the representative said he had the file and I'd need to mail him my disks so he could copy the file to them and mail them back. Big long time spent in transit over the country (Albuquerque to Ft. Lauderdale and back).

In short, does anybody have the file named COLOUR.LBM on their MicroProse Railroad Tycoon disks. The file is 148 in length - like it's counterpart, colour.pix. Please e-mail a copy of this file to me asap - I've been waiting to play this game for a Looong time.

Thanks in advance

David

I mailed the sources and binaries for version 0.6(beta) of ZOOSHELL
to weiner@atari.archive.umich.edu last night. You should be able to find
the program in atari/utilities/ before long. ZOOSHELL changes to any
directory you prefer. I does not yet create directories (or accept
command-line switches ;-}) because I haven't gotten around to it.

Message-ID: <1991Sep30.193831.9249@microsoft.com>
Source record: 228600

Next week, just before the WAACE show, I will be travelling around the east coast. Any user groups that would be interested in having me drop by with my TT to demo Quick ST 3.0, Quick Tools, or ST Xformer, please give me a call before THIS Friday (the 4th) at 206-885-5893 about visiting your user group any day from Monday the 7th to Friday the 11th.

On Saturday and Sunday (the 12th and 13th) drop by the WAACE show in Reston Virginia and drop by the Branch Always exhibit. Watch Quick ST 3.0 triple the speed of the TT's screen redraws, and ST Xformer run at full speed. Quick ST 3.0 will be available for sale at a special show price. If you are upgrading from an earlier version of Quick ST or Turbo ST, bring your original disks!

- Darek

3120. Install an app for two diff filetypes, term with IBM graphics option?

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 19:46:49 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <6446.28e738d9@miavx1.acs.muohio.edu>
Source record: 228599

I have two questions:

1. Is there anyway to install an application for more than one filetype?
I was wanting to install ARCGSHL 3.5 for both ZOO and ARC, and under TOS
1.0 I could just go up to install on the menu twice, once for each
filetype. Well, it won't let you do that under 1.4 :*(So I tried to
edit the desktop.inf file adding the required lines to install the
application for two filetypes. Well, my ST just crashed on boot up
then!! Any suggestions?

2. Does anyone know of a term program that can do ANSI and IBM graphics?
I have a local bulletin board that does IBM graphics, and I would like
to see what they are.

Thanks.....

3121. info wanted on bidirectional use of parallel port

Newsgroup: comp.sys.atari.st
Date: 1991-09-30 19:51:41 UTC
From: jsm@phoenix.Princeton.EDU
Message-ID: <14773@princeton.Princeton.EDU>
Source record: 228454

Hello,
I am designing a homebrew ADC/DAC board with a parallel printer
port interface. I need information about the ST printer port:

1) Is the port driven by a special chip or a bunch of latches
and drivers (as is done on an IBM PC-XT)?

2) Can I disable printer interrupts via software?

3) Can I drive data on the 'DATA' pins?

4) Do I get the full set of 12 TTL outputs and 4-5 TTL inputs
that I do with an XT?

To sum up, I want to come up with something that works with an Atari St
and most PC clones.

Thanks,

Scott

3122. Spice for Atari ST

Message-ID: <A13045@m.maus.de>
Source record: 228354

dinsmm @ aix.rpi.edu am Mo, 23.09.91 00:10 in ATARI.ENG

>driver. Every time I try to print out a document, it form feeds a page
>before it starts printing. What's up? And how can I fix this? I tried

Somewhere in your printer driver there is a command forcing the FORMFEED.
I asume, that you will find this command in the driver entry 1F (horizontal
initialization) of 20 (vertical initialization). Delete the command byte C
(FormFeed) from these entries and compile the driver again. If you didn't
found that command byte look for other entries with that command byte and
delete it. But beware: The driver entry 25 needs the form feed command.
(All numbers in HEX)

Hope this helps.

Greetings from munich
Martin

've a question to all atari programmers. my problem is a new mega-st1 with an megafile-30 hard disk. the tos version is V1.4 from Apr-06-89.

if you turn on all system components at once, the computer doesn't boot from the hard disk. so, i wrote a small boot program which is waiting for 10 seconds (reading the _hz_200 counter) and then returns with an rts to the boot sequence. this program is installed on drive a: .

now the system is running my little boot program and continues to boot from drive a:, ignoring all attempts to install a hard disk driver. the hard disk is configured for auto-boot wi rts

3126. Technical information on ST(e)?

Newsgroup: comp.sys.atari.st
Date: 1991-10-01 00:11:31 UTC
From: sourada@iastate.edu
Message-ID: <sourada.686275891@vincent1.iastate.edu>
Source record: 228455

I am a new STe programmer/user, and I have found that it is considerably difficult to get technical documentation on the ST(e) hardware and operating system. For example, all the Abacus books are out of print (and I'm sure that the used ones in existence are not parted with often...). I tried the number in the 'Welcome to comp.sys.atari.st...' file to find out about a developer's package, and wasn't able to get through (I got a 'this number has been disconnected' message) I have searched a bit through magazines and online texts, and have found almost nothing.

Does anyone have any pointers on how I can get some information to enable me to program the STe effectively?

Thanks,
Steven Ourada

Get a copy of ST-Report 739, it has all the fixes for that Game, you have
to rename files from what I remember.

But the chap that wrote the article in ST-Report suggests that all
owners of Railroad Tycoon send there disks back and ask for there
money back, he states that there are far to many Bugs in ST the port
of this game..

3129. GhostScript 2.3 on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-10-01 03:21:59 UTC
From: timg@ncsa.uiuc.edu
Message-ID: <58308@ut-emx.uucp>
Source record: 228459

Well, that was fast. I just uploaded GhostScript 2.3 binaires to atari.archive (atari/gnustuff/tos/ghstscrpt/gs23b.zoo) yesterday and they are already available for download. This is an old-style zoo archive (I don't have 2.1 yet). It seems that Mr. Higgins beat me to this anouncement, but a little remains to be said.

There are no really major changes from 2.2, but some conveniences have been added and an annoying bug has been worked around. GS 2.3 has a working epson driver, whose resolution can be selected from the command line. There are also command line options for redirecting output and bypassing a bug in 2.2 that causes a crash for multiple-page PS files. A few more drivers have been added, including an atari SLM driver (not quite polished yet) and an HP PaintJet driver (untested). I also put the LaserJet driver back in. See the readme.st file in the distribution for more details.

Source record: 228464

One thing you forgot to take into account, If you optimize your HD before you run any of those tests, the amount of time need to add or extract a file is significantly different. We use LHarc201d.ttp as part of our Network software. We found that many things can change how fast a file may be extracted or added to a file. Your test bed is flawed, a strict ram disk would have show a better corrilation of the true speed for extracting or adding a file. I will try it on our board and upload the differences.

Message-ID: <686311578.3@fquest.FidoNet>
Source record: 228465

Jeez, Richard.... now I understand why people pick on you so often. You want Atari to give you a TT so that you can port Unix programs to the Atari TT but with the type of ragging that your doing about the machine, it would seem that they would not throw away a computer on someone that is going to constantly put there stuff down.

Give is a break. The Atari is NOT the be all, end all of computers. There are several problems with the way they run there business, but its THERE business to run. I agree that Atari has problems but put a sock in it... I personally don't feel like being cut down just because I still own an ST and you should not be such a rag about it, You own two.... plus a lot of Hardware for it as well.

>archetecture (spelling?), with a cache. Much like AdSpeed (which I have, and
>which works well), it will run any instructions that fit in this cache at
>32mhz, but larger code will run at 16mhz (this is why AdSpeed is faster with
>some applications, generally ones that seem well written, than it is with
>programs written with cumbersome code). Has this changed? It would certainly be
>good news if it had!
>
>-David Butler-
>

Sorta. It IS a 32mhz proc in a 16mhz architecture with a cache, but if you
have TT-ram, the TT ram is counted as cache. So most applications that use the
high speed will fit entirely in the 'cache,' acting as if it was a 'true' 32mhz
machine.(animation is an exception, but I suspect the Blitter might help with
that). So, most of the time it will act faster than the 'true 25mhz 68030'.

Someone correct me if I've said anything disasterous.

I have a Calamus to metafont conventer and some Calamus fonts.
But there is a little problem as TeX needs some special letters
and signs to generate the whole character set. So is there a PD
font editor for calamus fonts?

I have an Atari 520 with 1 meg memory and a 45 meg hard drive.
I have about 15 meg partitioned for the mac and have loaded several
pieces of software onto the drive using my floppy drives(both
double density). Lately I can't do anything with the floppy
drives will doing mac emulation. The system will not read or
format eighter drives. I ran the test on the drives and get an error.
All the stuff on my hard drive works fine.
Any suggestions???

>
>Someone correct me if I've said anything disasterous.
Which part of the architecture is based on 16Mhz ? Please be a little more specific. TT-Ram is normal ram that is organized 32Bit width and can be accessed via burst mode. In my opinion a cache is something different, e.g. having a 'syncronized' (sorry I am no technican so this might be the wrong word for it) memory like in the ST (or the so called ST-Ram in the TT) and this does not let you access more than it is build to. If you want to use fast prozessors but have only this type of ram every ram access would be slowed down, so you use a small piece of high speed ram (the cache) wich maps often access areas of the normal memory.
But programms running in TT Ram do not need to access ST-Ram (they could if they want of course) and therefor run all the time in fast TT-ram.
So if you speak of 16Mhz Architecture this means for me that parts of the computer are slowed down due to some 16Mhz clock. The only thing I can think of what is slowed down is the 64Bit width ST-ram bus. There the videologic has to access the bus very often so the 68030 has to wait until the video-logic has finished their access-cycle.
So in my eyes the TT has fast TT-Ram and a big video/multipurpose ram which can be used by programms too, and I do not see any big disadvantages.

ciao,
Alex

>programs by including my sourcecode. If you use pfxpak, you have to pay,
>if you want the source, you have to pay more (I think, TQ will perhaps
>behave like that).

well, as i explained countless times, although the argument is certainly
weaker with pfx, i don't use any archiver at all unless i have source to
it. i want to insure that i can get at any datafile i have on any future
system i have. with packed executables, this is less of a problem because
they will generally only run on an ST. that is unless i go and load up
the .ttp file with other files as well. so far, i have used pfx on exactly
3 executable files out of hundreds. it does not make even a tiny dent in
my disk usage. i can (and have) disassemble it since it is not that big.
unfortunately, when my system crashed when trying to get lharc to work
with MW/ARGV extended args, it took my ramdisk along with it (where i
had the disassembled source temporarily - VERY temporarily in this case :-).
and no, i do NOT intend to give the disassembled source to anyone. it is
for my own use, for insurance.

i have on occasion, with software i use often, supported shareware. usually
with PC programs (PC write, AM Tax, etc). on the ST there are fortunately
lots of software, with source, where the author or or person doing the port
ask for nothing. i have never asked for a single penny with codes i post
here which i know more than a few people use (nroff, mgif, man/manpager,
etc). nor did the person porting zoo 2.1 for that matter. i have no problems
with people wanting to make a buck for their labor. i just don't tend to use
s/w on the ST that is not either of my own writing, or PD or whatever. and
archivers, for the reasons i outlined, i treat differently than any other
sort of program. when i post code, i generally always post source. and i
place no restrictions on its use at all. i generally don't even include
a copyright. and the code i write ends up in some odd places (nroff became
the text formatter for minix, tho i did not even write it for that purpose,
not do i even have an operational minix system). i just don't care that
minix is distributed (for profit) with one of my codes in source form.

requesting the source, in this case, will save me the time of disassembling
it, correcting the disassembled source, reformatting it, and annotating
it. pfx is small enough that this is no more than a couple hours work so

it is not a big deal. and if i intend to make widespread use of this program, i WILL disassemble it, and have source anyway. i don't think there is any law on the books that prohibits me from doing this, especially if it goes no further than my system, which it won't. it is a simple request to save me some time. with 80 MB of disk at my disposal, the couple of MB it will save is not a huge benefit anyway.

i would not disassemble a spreadsheet, database, or any other sort of program. but for me, archivers are different.

>drives will doing mac emulation. The system will not read or
>format eighter drives. I ran the test on the drives and get an error.
>All the stuff on my hard drive works fine.
>Any suggestions???

It could be a couple of problems I've heard about (and experienced). First I would try using SPECTRE format disks, not MAC format, and see if they work. To format a spectre disk under MAC mode, insert a disk and "ERASE DISK" (if it is already formatted): The key is to hold down the shift key, OR the right mouse button (depending upon you settup the right button is your shift key also) while you click in the final "TWO SIDED" button, or the "OK" button (may be something else depending on what version of the system you are using). If this does not work, then I no idea whatsoever what the problem could be, except for
1) really cheap crap disks (I had this problem with bulk disks)
2) some problem with the software installation, try reinstalling the software

Now... If the machine uses ST and SPECTRE disks perfectly, then it is probably in the GCR (I hear some model after-market drives don't work properly, but since you said it worked for a while, this should not be the problem). It could be two problems that I know of:
1) Your drives need the potemiter in the GCR adjusted
2) You need to shield your drives (I have never heard of this problem except with megas (like mine), but you never know)

To fix the first problem, open up the GCR itself, there is a little "potemiter" (or something like that), with a slot for a screwdriver in the top. This can be rotated GENTLY in either direction. It has a definite stopping point, so don't force it. Run the GCR test, and adjust the Potimeter (I suggest going clockwise first, this seems to fix most of them) each time it goes through an entire check (don't use the quick check, and make SURE you use a very good brand of disk, SONY or 3M... The new BASF disks are no longer of the same quality, don't use them). Do not adjust the potemeter except after each test, or you will never figure out the problem. When the test checks out, leave it there! It may not have a position that checks out 100% for both drives, so pick one (I suggest the internal one) and just test it. The other drive should still be able to use spectre disks fine, even if it won't use MAC disks.

The second problem is harder to fix. I tried to shield an external drive once, with no luck at all. I suggest doing it to the internal drive, even though you

have to open up your machine. I did this in a mega, and am not familiar in the least with the internals of the smaller machines. I used aluminum foil, and wrapped the drive itself (leave the back open for cooling if possible), the data wires, and the power wires in it. I then wrapped grey (duct) tape around the data and power wires completly, to prevent shorts. I made damn sure the foil around the drive could not come off and short anything out. Ever since I did this my drive works 100% great with all good brands disketts, but still gets problems with cheaper ones occasionally. Megas have crappy shielding! You will probably have to shield the drive and then put the entire machine back together before it will work properly, at least I did.

If neither of these things help, take your GCR to another machine and test it.

There is a possiblity that it is the GCR itself, Gadgets is very good with service, and will probably have a new one out to you within a week of recieving your bad one...

Disclamer: IF YOU TRY ANY OF THIS AND SCREW THINGS UP, IT IS YOUR FAULT, NOT MINE! IF YOU ARE NOT THE ADVENTURESOME TYPE, HAVE A PROFESSIONAL DO YOUR DRIVE SHIELDING!

Good Luck

- David Butler -

- Innagaddadaviddababy -

- I still think the world is falling apart -

For example, have you noticed that newer books are printed on paper that yellows and gets brittle in about 2 or 3 years. This is because they use bleach (and other chemicals?) to whiten the paper. If you buy a used copy of the same book printed before about 1970, it will last you years longer than buying a new copy off the shelf (and cost you less too!) I think this is a conspiracy to keep poor people unread...

In article <9606@mcshh.hanse.de> the.fawn@mcshh.hanse.de (Thomas Quester) writes:
>LHarc is only partly written in assembly-language. Some parts

i am sure the parts in assembler are the parts that are highest on the
profile.

zoo does its thing in 100% portable C. the same code i run on a supercomputer
will compile and run on my ST with little if any changes. and it will run
about as fast as lharc and will produce files of similar size.

>of the coder itself are in C. It only is a long hand hard way
>to produce a higly optimzied version of about 1000 lines of
>nearly undocumented source. The rest of the coder and decoder
>will be written in assembly language some times later. It took
>some version to make 1.13 four times faster.

tho i laud your efforts in making (your) lharc scream, i still cannot unpack
lh5 archives on non-atari (eg unix, VMS, etc) systems. it sounds like the
original C for lharc was really bad. i do contend, however, that it would
have been far better to 1) restructure the C, 2) profile the code, isolating
hot spots, 3) find the reason why it is slow and remedy (try inlining,
register variables, -O in gcc, etc), and 4) provide the source. zoo does
exactly that. the changes made to zoo to get it to run and to run fast
are minimal.

>>i tried:
>>
>> lharc a lll *
>>
>>and my system crashed! lharc does NOT handle extended args. and what's more
>
>It does handle the ARGV, but only up to 200 filenames. I bed
>you to retype your command, maybe someting went wrong earlier.

i did not have 200 file names. more like 15, but longer than the 125 or
so chars Pexec handles. this is obviously a bug in your ARGV which is
appearently not capable of handling MW-style ARGV. zoo (actually GNU C)
ARGV support does.

>> - nitpicking: zoo lists files one per line. it is easier to grep
>> things out for more specialized uses (like making lists of all
>> .c files with their statistics).
>
>Why not use lharc l archiv?

ok, i will. this was a minor detail. with virtually every other archiving
system, the syntax "xxx v archive" gives me one line per file format.

lharc uses 2 lines. it is not consistent with arc and zoo. and it is
a VERY minor detail (nitpicking). i only mention this because i sometimes
do use the archive listing for other purposes than listing it to the
screen. it is not a big deal.

>> - zoo 2.1 can extract files from ANY zoo archive of equal or
>> lesser version. older versions of zoo can list any zoo archive
>> even if made with a newer version. if a newer version is needed
>> to extract files, the older zoo tells you what version you need.
>
>So Lharc does. It will not say the version number, but give a
>message "unknown method". Though there are some versions of
>LHarc availbe without this test (for example unlzh).

no. some older versions of lharc will die and crash the system on some other
(newer) lharc formats. what i was saying is that zoo 2.01 (?) will list
a zoo 2.1 high compression archive, but it can't extract files, but it
1) tells you the version you need to do so, 2) will not crash. the big
difference is that rahul dhesi takes an active part in zoo. yoshi does not
appear to, at least in the US. and like i've said a zillion times, there is
only one zoo. responsible people doing ports send the changes back to
rahul so he can sanction them and incorporate the changes for the next
release. this, from what i can tell, does not happen with lharc. there are
many, many incompatible lharc programs, as you of course know. that means
there is no standard lharc on every platform. yours may be standard on
the ST, but it is far from universal (like zoo or arc). there are unix
and VMS versions of these. there are none for lharc 2.01e (because of the
assembly language). again, i offer to port it to unix where it may run
slow, but it will at least run. do u understand the differences i try
to point out here? the ST is not the center of the universe with respect
to archivers.

i think if ARJ is as good as people say, then both lharc and zoo will die
anyway. so perhaps i am wasting my time.

I, too, experienced this problem when trying to run it on a hard disk.

In order to fix this I just copied first disk one and then disk two to
the directory on the hard disk. When doing disk 2 it asked me if I wanted
to overwrite the files present (which came from disk one) and this I did.

Naturally you wonder if the dupes on the disk were important but I've been
playing the game for a week now and it didn't seem to do any harm.

There is a lot of bugs present when you have lost a game etc but I still
haven't found myself trapped when *in* the game.

In other words I don't think the external bugs have any counterparts when
running the game itself.

It sure is the first buggy Microphrose game I've owned anyway and I don't
like it at all, they used to produce stuff that were better tested than this.

>corrilation of the true speed for extracting or adding a file. I will try it on
>our board and upload the differences.

i did not fail to take this into account. i did discuss the HD issue. i have also pointed out that unless a partition is clean, i very well could produce wildly differing results if significant i/o takes place. at least the ramdisk offers equal footing, if you do alot of archive manipulation in ramdisks (which i do, BTW). i know that this test may not be representative of many situations, that, in effect, i cancelled i/o from the equation (which i realize could be EXTREMELY significant). i did mention this, however. at any rate, the test does point to the actual compression speeds, minimizing i/o since it is MUCH faster to go to memory than disk.

if i had an empty partition (if i EVER have an empty partition :-) i would have done the test in both the ramdisk and the HD. i would have compared the relative speed ratio ramdisk/hd for each program. note that with zoo, i could also have profiled the code and isolated the routines where most of the time is spent. i believe bill shroka did that when he ported zoo 2.1.

i look forward to seeing a thorough test, similar to the one i did, but in HD partitions. just be aware of these potential variables, however:

- disk access speed (run both with similar disks)

- disk interleave

- amount of pre-existing data in the partition and the amount of fragmentation. ideally, you want to run these tests in the same empty partition.

- location of temporary files. ideally, and i am not even sure this is ideal, you would want the temporary files to be located in the same partition as the test. be careful with environment variables called "TMP" or "TEMP". if these point to a ramdisk and one of the programs use this while the other does not, your test is biased. or at least point out that one has this feature and the other does not. that would be a signifiant plus, IMHO.

i tried to eliminate all of these by simply working in a ramdisk for the first cut. i would tend to think that both programs do similar amounts of

i/o, so the program that uses bigger buffers and/or inlined i/o will probably win. i don't know which one that is.

if you can do this over a network, that would be another interesting set of datapoints. however, in equal environments, i would expect both codes to function about the same.

good luck. please post the results...

I saw a combo-pack at B&C Computervision in Santa Clara: Sim City and Populous!

Great combination, retail price is around $60 I think. If you've kind of
wanted either game, this is the package to get, as well as support ST s/w
development!!

|> good news if it had!
|>
|> -David Butler-

Maybe there are some limitations on reading and writing to ST-ram, diskcontrollers and i/o ports, but as I have understand it, there is no limitations to the TT-ram. A third-party TT-ram-card manufacturer have made a card which supports the 68030 syncronous mode. That means that the processor can read and write to memory in only 2 clock periods and to make this work correctly there can be no delays at all in accessing memory.

>money back, he states that there are far to many Bugs in ST the port
>of this game..
>

Later comments from the same chap said that the game still crashes,
even with his attempted fixes. A local store tryed the 3 meg reset-proof
ramdisk fix, and claim it still crashes. The store says the distributer
says that Microprose will issue a fix but no one's sure when. Considering
Microprose's history with F19, I'd say we're not likely to get much
satisfaction from them.

Does anyone know how to get the Mercury UUCP package to handle
long group names? Mail to Rodney goes unanswered, but doesn't bounce,
so I don't know if he's still around. I've tried to get the group
alt.society.cu-digest, and it just doesn't show up. I tried truncating
the name in my sys file, but that doesn't work. Any ideas.--

I just purchased a 1040STe and am wondering the best,
most inexpensive, most reliable way to upgrade my system.

Can I just go out and purchase some simms, crack the case,
and plug them in?

Any comments would be appreciated.

Thanks in advance - Wayne

In <A48787@bn.maus.de>, Klaus Guhr writes:
>
>Allright - but what is DAVI?

The MATRIX M110 Software consists of two parts. On one hand we have GOLI(ATH), which is a monitor-driver including full GDOS support. As I know, it's written by Arnd Beissner, the author of AMCGDOS. The other driver-kit is DAVI, which doesn't support GDOS, but has an extended LINE-A emulator and is much faster than GOLI. It's written by some guys from France. As I stated earlier, MATRIX has not made updates until now, because they don't believe in b/w-monitors any longer. With their new 24-bit video-cards they are on right way to open the ATARI for applications like CALAMUS SL, RETOUCHE PROFESSIONAL and other phenomenal software.

Bye.....Michael

}
}If I'm wrong about any of this may Allan Pratt or Ken Badertscher correct me
}(gently :-).
}
}I think the best way to write such a screen saver would be for the saver
}modules not to be proper programs as such but loaded by the saver accessory
}in much the same way as accessories are loaded by the desktop. This get's
}round any Pexec problems. The saver should malloc some memory for the module,
}load it in and relocate it. Now before you all start shouting "Hey acc's
}shouldn't malloc memory"... [rest deleted]
}Whadaya think?

Well, it's not what I wanted to do... :-)

a) What's the problem with Malloc() inside an ACC? Beyond the possibility
of fragmenting your memeory, I can't imagine anything going wrong...

I wanted to make it easy for _anyone_, not just an assembly guru to write
a module for it. Loading the modules all at boot time also goes against
the idea behind this thing.

The main point is, it's to be an EXTENSIBLE Screen Saver. You could have
2M of modules sitting in your XScreen folder (well, if it caught on and
lots of people wrote modules) and you wouldn't want to load them all when
you booted. You'd just want to load the one that was going to be
executed when the screen saver went off. When you were done (ie, work your
ST back up), it'd get deallocated.

There's another problem --> I haven't got the assembler smarts to write
any sort of code that'll relocate and execure a module the way you
suggest, with a special header/whatnot. I can't even use XBRA without
the routines somebody else wrote and uploaded to a.a...

Well, that is what I said, after all, 'has no effect except for animation' and
/o. I can also see no major disads though it might have an effect on real-time
ni, though, like I said, if the blitter can speed up bit-block transfers, it
might be able to surmount that problem. ^^^^^^^^^^^^^^^^^^

of course it can, I meant
bettween TT and ST ram.

>very confused about the bugs reported by you (archive time not correct,
>no ARGV support, no UNIXMODE). So I tested these things on my machine (Mega
>ST 2, German TOS 1.04, Gemini 1.21).

ok, fair enuf. but people are already saying that it works with TOS 1.4.
i, unfortunately, do not yet have TOS 1.4. i have 1.2 in my mega. i have
no desire to change at the moment. i don't think TOS 1.4 has that much to
offer me personally. i don't use the desktop.

>>test platform is mega4 (4 MB) 8 Mhz, TOS 1.2, using gulam CLI. environment
>Well, nothing against you personally, but TOS 1.2 (or, in Atari's new
>spelling, TOS 1.02) is an OS from stoneage, TOS 1.04 is the actual OS.

that is still no excuse. when i first started programming the ST, it was
always high on everyone's list (especially atari's, and rightly so) to
make a program compatible with all TOS versions. not being able to predict
the future is one thing. not being able to deal with _existing_ older
OS releases is just plain unacceptable. i myself have been beat on the
head about how i choose to draw pixels. in 1986, line A was consided
fine to use. with the TT, it is not. only in 1986 there was no TT.

THERE IS NO EXCUSE FOR A PROGRAM LIKE LHARC NOT TO WORK CORRECTLY ON
ALL TOS VERSIONS AND IN MOST REASONABLE USER ENVIRONMENTS!!!!!!

how often do u want me to say it? i even provided the evidence which
you can independently confirm with a similar configuration. the code
has a bug. period.

AND ZOO HAS NO PROBLEM WITH TOS 1.2 (and i suspect it has no problem
with 1.4 either). so why can zoo do it right and lharc cannot???????

>Perhaps it's TOS 1.02???

no, it is LHarc's inability to deal with TOS 1.2. TOS 1.2 is fine. zoo
proves that it can be done.

>mw? Jesus Christ! Mark William's method for passing extended arguments is
>not, I repeat, NOT correct. LHarc (and Gemini) both use the official

unfortunately, MW-style ARGV pre-dates official ARGV. and again,
zoo can deal with both. why can't lharc??????????? i don't use gemini. i

use gulam. zoo works perfectly with gulam. i suspect zoo works perfectly with gemini as well. i have used gulam for 5+ years. i further suspect that lharc will have the very same problems with a state-of-the-art command shell like bash.

>Mark William's are "cooking their own soup", as we Germans say it.

MW cooked the soup that atari gobbled up for their standard. if anyone changed something it was atari. MW had it first. but again, zoo deals with BOTH. WHY CAN'T LHARC?????? (i have no problem with atari on this, by the way. nor can i claim to be knowledgable about what actually transpired when MW extended arg scheme was adopted by atari. this is just my best recollection of the geneology of ARGV. corrections are welcomed).

i'll say it yet again: if i had the source, no matter how convoluted, i could fix it. i cannot find the source to lharc 2.01e anywhere. if you have it, send it to me.

>> - there is one version of zoo 2.1 (that i know of) for ST, unix, >> and PC. i stopped counting the versions of lharc for the ST >> alone at about 6 or 8. there is only one author of zoo.
>How many LHarc versions do you need? I came a lot of lharced files, >created by almost every lharc ever programmed on this planet (including >the unix and amiga lharc). I start LHArc 2.01e, and it decompresses them.

if you have a unix version (or any version mostly in C) that will create and more importantly extract files created with the lh5 compression scheme, please send them to me. i just can't find a source for the source code. the last version of lharc for unix i ever saw posted was 1.02 this summer, i believe. i have it, but it cannot extract files made with the lh5 format. this is all i really want (and need). i see zoo as an answer to this lack of portable source code. zoo works fine and source is easily available. lharc 2.01e creates files that i can't extract unless i download it to the ST. maybe i don't want to download a 500kB file unless i read the documentation first.

>1.) There is no significant difference in archive sizes when comparing >zoo 2.1 and LHArc 2.01e. STZIP 0.9 beta falls out of the comparision since

exactly.

>doesn't cost my money, so I don't care that much about the time used.

ok, i agree here as well

>2.) The often stated LHArc fiasco or chaos is over, thank godness. LHArc

it is not over until all LHarc programs (PC, unix, VMS, amiga, st, ...) can each pack and unpack archives for and by each other. if they cannot, then how can you possible say 1) these are the same programs, 2) they are compatible. as far as i know, and no one has stepped forward, there is no unix or VMS version of lharc that can do this. there may be an ST version (which i already admitted is probably the best ST version). as i see it, there is an ST lharc standard, an amiga lharc standard,

a PC lharc standard, and (possibly) a unix/VMS lharc standard. none of them are identical. there is no single lharc standard. there IS a single zoo standard.

>2.01e was able to handle all LHarc archives I ever got (and being res-

that is not the point at all. i want to use a 2.01e compatible version on another non-atari system and i can't.

>3.) Porting LHArc to Unix is not the big problem one could believe when >reading your article. Sources for the old format (used in the 0.xx and 1.xx)

yes it is since the last unix release was 1.02 and it does not handle lh5 format (he said for the 1000th time...)

>version are widely available, the sources for the new format (created by >2.xx) can also be found. Check out for the sources of Amiga's AR. This is

where is a 100% C version of lharc that supports lh5 available? i have been asking for this for weeks. it is the one thing guaranteed to shut me up (until lh6 appears, at least :-).

>If you can't get them, feel free to ask

ok. i am asking: PLEASE SEND THEM!!!!!!! but make sure it handles lh5. even if it is not 100% C. right now i'll settle for a TI-59 version...

Message-ID: <1991Oct1.204119.29637@mailer.cc.fsu.edu>
Source record: 228351

Hey has anyone gotten the Delirious demo (two .msa files for one disk on atari.archive) to work? I have a virgin Mega2 with TOS 1.2. I tried twice.

By the way, this and two other recently posted demos consist of two .msa files, one for tracks 1-40, the other for tracks 41-82. This means that the two .msa files map to one double-sided disk. The other two demos are "The Dark Side of the Spoon" and "Ooh Crikey Wot a Scorcher." Both are great! If you have a color monitor, you should check these out!

Where does Manikin go to school, anyway?!?

3160. Re: lharc 2.01e vs zoo 2.1: some tests

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 02:32:18 UTC
From: DE7B@br1.hrz.th-darmstadt.de
Message-ID: <1991Oct02.023218.28662@infoserver.th-darmstadt.de>
Source record: 228491

Following the discussion I tried three archiver programs
to backup 151 files worth 700KB of data. The data consisted
almost entirely of documentation (ASCII) and C source.

Machinery: ST-1MB w/40MB ST-251-1
I did NOT clean my partition for this test, why should I? I
never evacuate any partition just for arcing things up. So
I think this is more true to life, than any more 'scientific'
setup. I did the test twice, which didn't change any of
the timing values significantly and gave every program
a 'fair' chance on a equally fragmented harddisk. Fragmentation
is more of an issue when unpacking anyway.

Results:

ARC 6.02
Size: 304048 bytes Time: 3:48

ZOO 2.1
Size: 307207 bytes Time: 4:45
after issueing a pack command for an additional 2:20
Size: 307151 bytes

LHARC 2.01d
Size: 218964 bytes Time: 6:13

(my) conclusions:
So guess what, good old ARC is by far the fastest,
LHARC is the tightest,
And ZOO well the -um- most compatible...

And they way I called them (thru make)

3162. *.doo PICTURE FORMATS

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 06:24:24 UTC
From: t821431@minyos.xx.rmit.oz.au
Message-ID: <1991Oct2.062424.28939@minyos.xx.rmit.oz.au>
Source record: 228481

What programs are available that allow one to draw/paint in *.doo picture formats?

I am chasing a program that does such format!

Many thanks in Advance

Richard Clarkson

>filetype. Well, it won't let you do that under 1.4 :*(So I tried to
>edit the desktop.inf file adding the required lines to install the
>application for two filetypes. Well, my ST just crashed on boot up
>then!! Any suggestions?
>
Well, it should work. I run EXE_260, another ARC-shell from here and
it installs itself in the DESKTOP.INF file. Take care that each line
in the file has a trailing space before EOL, which is needed by the
desktop.

My DESKTOP.INF has the following lines in it to install my ARC shell:

```
........some lines del'd........
#P 03 FF *.TTP@ @
#F 03 04 *.TOS@ @
#G 03 04 D:\ARC\EXE_2_60.PRG@ *.LZH@
#G 03 04 D:\ARC\EXE_2_60.PRG@ *.LZS@
#G 03 04 D:\ARC\EXE_2_60.PRG@ *.ARC@
#G 03 04 D:\ARC\EXE_2_60.PRG@ *.ZOO@
#G 03 04 D:\ARC\EXE_2_60.PRG@ *.SFX@
#G 03 04 D:\ARC\STZIP.PRG@ *.ZIP@
#G 03 04 C:\BIN\EH_MGIF.TTP@ *.GIF@
........etc.....................
```

Bye.....Michael

3164. SLM804 laser printer

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 08:14:56 UTC
From: dcrevier@jarthur.claremont.edu
Message-ID: <1991Oct2.081456.1931@muddcs.claremont.edu>
Source record: 228484

I recently got a SLM804 Atari laser printer, and I have a few questions.

1. Using Pagestream 1.8 (I don't have the money to upgrade at the present), I cannot get it to print with the DMA version, but the other version using the Diablo emulator works. However, selecting manual feed does not seem to have any effect. I have used the manual feed in Ultrascript sucessfully, so I know it is a problem in the SLM drivers in Pagestream, not something I am doing wrong. I can always output the files into a disk file as postscript and then print them out with Ultrascript, but it would be much more convenient to print directly. Does anyone know if there is a newer SLM printer driver for pagestream? Mine say beta version.

2. I purchased Ultrascript, and it has a folder called NUFONTS that contains files with extensions .QFM and .OTL. It never mentions the existance of this folder, or of these file types in the manual? What are they? Also, does Ultrascript replace Tymes-Roman with Lucida normally? If not, can it be made to?

Thanks

Dan

3167. Working with EPS artwork on an ST

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 12:21:01 UTC
From: covert@cactus.org
Message-ID: <9548@cactus.org>
Source record: 228494

I just got some mac clipart that is in Macintosh EPS (encapsulated PostScript) format. Are there any drawing programs, or DTP, which can handle these clip arts? I have the outlines of each of the United States and would like to use them in some letter (maps from my current home to relatives, stuff like that).

I have PageStream 2.1 but haven't tried EPS with it yet.

Can you add lines on top of EPS imported into Pgs 2.1?

Does PgS2.1 allow you to view EPS on the screen?

If not PgS then what?

I guess I could look for a Mac program (which runs under the Spectre GCR) and do the work in Mac, but I wanted to see if it could be done in the ST.

3168. Re: STE simms

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 12:39:08 UTC
From: data3d@aahs.no
Message-ID: <"1021*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228376

[Wayne Martinez writes]
>Can I just go out and purchase some simms, crack the case,
>and plug them in?

Obviously. At present I've got 4 9-bits 70ns 1Mb simms installed in my STe, giving me a total of 4megs. I got the simms 9-bits (8-bits will pass, I think) and 70ns (100ns should be enuf?) so that I'd be able to use them on a PC or a Mac, should I decide to do so.

Mind you, all of this may be wrong. Correct me if it is. ;)

3169. 6 new Macs from Apple...

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 13:43:05 UTC
From: data3d@aahs.no
Message-ID: <"1022*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228490

Apple recently announced the release of 6 new macs. The probably most interesting of these are the three 'powerbooks'. These are an answer (pretty late, if u ask me) to the PC notebooks. There will be two 'regular' powerbooks, the first with a 68000 processor and the second with a 68030 processor. The last powerbook will feature no keyboard, and is operated by writing direcly on the screen with a pen (sounds pretty familiar, hm?). All of these will weight in the vicinity of 2.5 kilos and are produced in cooperation with Sony.

Also Apple will launch two new Macs with using the 68040 processor. (How do you like that, Dave Small?) These will run by the name 'Quanta'. There will be a desktop and a floor version.

Eventually there's a replacement for the SE/30, the Super Classic.

Any comments? ;-)

>Most of my old PD programs do NOT work with my new Mega Ste. I've been
>told that any program that did not strictly follow the Atari programming
>guidelines and 'cheated' will probably not work with the new 2.01 MegaSte
>TOS.

This is not true, most 'old-tos' programs works. The only programs I've found
NOT to work on my 4meg MegaSTe (Tos 2.05) are those who:

1. checks the TOS version number. (They obviously don't know about 2.05)
Example: Laser C. They typically come up with a "Does not work with this
TOS version" message.

2. use undocumented system variables or ROM adresses. Atari may tell you that
these programs 'cheated', but in the old days you HAD to cheat!
Most of these programs didn't work with 1.6 or 1.62 either...

3. look at $fc0000+ for TOS version numbers etc.. The ROM is located at $e00000
on STE machines.

4. try to access memory above $400000. (Like any disk with the Medway Boys II
bootsector). This does of course stop these programs from working on ANY 4
meg machine. Use any decent viruskiller to replace the bootsector.

5. use badly coded sync-protection methods (a few demos, and a couple of
games). Check out the bootsector in the latest Lost Boys demo for an
example of a working sync-protection. (I think it was the Lost Boys demo,
but it could have been any of the latest demos...)
Remove the protection and they usually work.

Except for the shifter-bug I'm very happy with my MegaSTe, and program
compatibility has not been much of a problem.

Cheers,
Torbjorn Ose <edb02@dhmolde.no>

]>
]>>The Motorola 68000 series of microprocessors have an asyncronous bus system. T
]>here is no 16MHz or
]>>32Mhz or xxMHZ bus system in the TT. As you probably know, the MC68030 can rea
]>d from TT-ram
]>>in burst-modus and this is as fast as it can be. It is not limited by a "slow
]>bus".

I think it can. The TT has a 32 Mhz processor clock, but all other stuff
(including the custom made memory controller) operates at 16 Mhz.
I suppose this will slow down memory access.

]>>
]>>Stig Vidar Hovland - stigvi@lise.unit.no
]>
]>Is this true? I admit to confusion, everyone has been saying (including Dave
]>Small, who knows such things), that the TT is a 32mhz chip in a 16mhz
]>archetecture (spelling?), with a cache. Much like AdSpeed (which I have, and
]>which works well), it will run any instructions that fit in this cache at
]>32mhz, but larger code will run at 16mhz (this is why AdSpeed is faster with
]>some applications, generally ones that seem well written, than it is with
]>programs written with cumbersome code). Has this changed? It would certainly be
]>good news if it had!
]>
]>-David Butler-
]>

]Sorta. It IS a 32mhz proc in a 16mhz architecture with a cache, but if you
]have TT-ram, the TT ram is counted as cache. So most applications that use the
]high speed will fit entirely in the 'cache,' acting as if it was a 'true' 32mhz
]machine.(animation is an exception, but I suspect the Blitter might help with
]that). So, most of the time it will act faster than the 'true 25mhz 68030'.

No.
The 68030 has an onboard instruction cache and an onboard data cache.
If a cache hit occurs no data has to be fetched from the bus. This means
that data access in the cache is always faster (if I'm not mistaken the
cache search and the external bus setup occur simultaneously, and if
there is a cache hit, the external bus access is abored).

So if an instruction is in the cache no opcode fetch is needed.

TT ram is *NOT* counted as cache. In order to access TT ram you still have to access the data over the bus. So you do get an opcode fetch cycle when reading an instruction from TT ram, while you don't get one if you read from the internal cache.

TT ram is faster than the (regular) ST ram. This is due to the fact that the processor is slowed down by the video hardware when accessing ST ram. The video can only live in ST ram, and every 250 ns or so the video accesses the ST ram. During this time that ram is not accessible by the CPU, thus causing delay when accessing the memory. Since the video hardware cannot access TT ram this CPU blocking does not occur when accessing TT ram. That's why TT ram is faster.

By the way: would it be possible/advantageous to use burst fill mode on the ST ram? What about the video?
The 68030 can be set to either burst fill or no burst fill. However you cannot do that dependent on the memory address used.
I did some rough measurements (dhrystone), but it seems that burst fill or not does not have a great impact.

]Someone correct me if I've said anything disasterous.

I'm doing so right now..

>system for writing documents using MS Word. (I assume this will
>work?). Some of the questions I have are:
>
>1) What Version of the Mac system software is recomended and why.

Depends on what you want. 6.0.5 has sound, but 6.0.7 has True Type, I use 6.0.7 with no problems, and would recomend it to "serious users". Less serious users may want to use 6.0.5 so they can have all those nifty sounds that will drive everyone else crazy.

>2) What inits etc. do you recomend.

Too many to list, the important ones are (and some are really more than just INITS & CDEVS, but I'll list them anyway).
1) ATM (Adobe Type Manager, like true type, but faster and better)
2) True Type (need 6.0.7, not as good as ATM, but includes the system fonts, which is nice)
3) Access PC
4) Init CDEV 3.0
5) Disk Light (you have to buy Norton Utilities)
6) Everything else with Norton
7) Suitcase II
8) Boomerang
9) Windows
10) Windchooser

>>3) What about printout to an Epson FX printer (Normally I will save
>the file as Postcript and print on a laser so quality is not an
>important factor.)

In the manual that came with your GCR there is a listing for GDT Softworks in Washington DC, call them and get their Epson drivers, they are the best ones.

>4) What other applications work well with GCR. Particually a Object
>Orientated drawing package like EasyDraw on the ST.

Every major application works on the GCR. I recomend UltraPaint, it has a great set of paint and draw features, that can be combined. Generally, the Mac drawing software is better than the ST, but you will be limited to B&W (really 8 colors, but you won't see them) when using the GCR.
If you want Postscript, there is Aldus Freehand and Adobe Illustrator (I like Illustrator better).

>5) Since I am happy with my ST setup I would like to minimise the
>amount of time that I have to resort to the GCR so is there any pogram
>that can write MS Word compatible files? Or is there a converter for
>say Thats Write To MS Word?

As far as I know there is no ST wordprocessor that is compatible with and Mac word processor except through text files. Why get an ST wordprocessor if you have the GCR? Wordprocessing is one area in which the Mac really shines, beats the ST software hands-down. Try Write Now or Nisus, Write Now is faster and less complex, but Nisus has features to blow your mind (far better than MSWord, and it does write MSWord files). Really, these are as far above ST word processors as an ST is above a calculator (a cheap one anyway).

>I am thinking of buying a new ST Wordprocessor (I currently use First
>Word) what do you recommend bearing in mind that I would like it to be
>MS Word compatible.

See Above

>I am aware of MS Write but this program is a bit buggy and does not
>even have a spell cheacker. (As I think you can see I realy need
>one.)

Everything on the Mac comes with Spelling checkers and generally a Thesaurus. MSword does not have a good spell-checker OR thesaurus, but it does have them. Try WriteNow or Nisus (trust me :-). Buy them from somewhere with a good return policy in case you really hate them...

>6) How do you recomend that I go about backing up my Mac partition.

Get a Mac HD backup program (I think Norton has one, but I don't remember), they all (at least, all the ones I have tried) work fine as long as you use MAC format disks and not Spectre format disks.

>7) Any other hints or horror stories you have to offer.

See an article I posted about a week or two ago (I forget the Subject, maybe "People dumping machines" or something like that). It has a blurb at the end about Hard Drive speed, read it because it will speed up your MAC boot time by astronomical proportions.

>Many Thanks.
>
>Dave Halliday.

PS, I have been posting my answers to Spectre questions back to comp.sys.atari.st because I thought that there may be a lot more users with similar questions out there...

- David Butler -

- I still, still think the world if falling apart -

For example, "DeRevolutionus Orbium Celestium" (DeRev), by Copernicus, was published in (approx.) 1543. 500 original copies were printed, 490 of those have been traced to being still in existance! Try do that with any modern

publication, it would turn to dust.

- Innagadaviddababy -

- What ever happened to free love anyway? - (no more smart comments about inflation please :-)

3174. Monochrome/Color Emulator for the ST.

>#ARC=zoo
># update
>#UPDATE=aun:
># update with subdirectories
>#DIRUP=aun//

i am sorry, this is NOT zoo's high compression mode. no wonder your results
make zoo look bad (but fast :-). you need the "h" modifier. and they say
i am biased :-). try again....

>I did NOT clean my partition for this test, why should I? I

you should clean it because if you have a partition with small gaps in
it, and the archiver tries to write a big chunk, the head will be foreced
to seek to the next free space on the disk. if you can guarantee the SAME
head motions for all your tests (i.e. no small gaps in the data on disk),
then you don't have to clean the partition. otherwise, this may not be
a fair test. at least when i did things in ramdisk, it was. the time to
hit any bit of memory is the same. this is NOT true with mechanical disks.

>never evacuate any partition just for arcing things up. So
>I think this is more true to life, than any more 'scientific'

fine. i can make a "true to life setup" that makes any archiver look
terrible. like how about if i run zoo in ramdisk and lharc (or arc) on
a floppy? "but hey. that's how _I_ use it. true to life (for me)." your
tests are not that bad, of course, but they are not that good either.
they are not reproducable by others since we cannot ascertain the exact
state of your hard disk. i'll take scientific over hearsay anyday.

>setup. I did the test twice, which didn't change any of
>the timing values significantly and gave every program
>a 'fair' chance on a equally fragmented harddisk. Fragmentation
>is more of an issue when unpacking anyway.

this may be good if you ran the programs in different order. you don't say.
fragmentation is equally important, and maybe even more so on packing since
all the archivers i know make temporary versions of the archive and either
copy or rename it when done. there is probably more i/o during archive
creation, and especially updating, than during unpacking. by not seeing
"significant" differences (whatever that means) you may have just gotten
lucky. or your partition had no gaps in it (again lucky, and hardly true
to life).

also, a partition 10% full will give MUCH different results than a partition
90% full, especially if it is a large partition. mine are all 75% or more
full and 5 out of 7 are at least 12 MB in size. another reason i did not
want to do this in a HD partition...

>ARC 6.02
> Size: 304048 bytes Time: 3:48
>
>ZOO 2.1
> Size: 307207 bytes Time: 4:45
>after issueing a pack command for an additional 2:20
> Size: 307151 bytes
>
>LHARC 2.01d
> Size: 218964 bytes Time: 6:13

i suspect if you use zoo's high compression option you will see similar
results compared to lharc (if my tests are an indicator, i would say zoo,
compared to lharc, would
be about 15% slower, and 0.5% larger in the resulting archive). and to be
fair, this version of lharc is not the most current. we are up to at least
2.01e. that could be harmful to lharc. the only problem i have with arc
(note that most things i post to the net are .arc files) is that there is
no version of 6.02 for unix or VMS (that i know of). otherwise arc 5.21 is
100% acceptable alternative by me, anyway. i'd much rather use arc than lharc.

>(my) conclusions:
> So guess what, good old ARC is by far the fastest,
> LHARC is the tightest,
> And ZOO well the -um- most compatible...

_my_ conclusions: run your test again with zoo ah// ... and report THOSE
results. if you are going to be credible, you must be accurate. if not,
don't bother. and this is not "good old ARC". it is a relatively new
version. i would call arc 5.21 (and older) "good old ARC". however, if
you were refering to the fact that arc has beed around since the beginning
of time, then it is "good old ARC".

if you knew how to run zoo correctly (um!) you would find that zoo is as
slow as lharc, and that it offers 30+% better packing than arc (like lharc).
you would also find that, like lharc, as far as i know, there is no source
code available for arc 6.02. if there is, kindly post it here....

l>yield problem inherent in co-operative multitasking than evnt_timer(0).

No, it has not been implemented yet in Atari GEM. There is an undocumented
method to cause Atari-GEM to execute an in-fact appl_yield(). But nobody
guarantees that it won't disappear in future TOS-Versions.

Patrick

^^^^^^

Hmmm, something fishy here . . . zoo 2.1, using the high compression scheme,
should be closer to LHARC than this.

>
>#ARC=zoo
>#  update
>#UPDATE=aun:
^^^
```

Yup, this is a zoo 2.01 compatible archive, not a 2.1 archive. To use the high compression method, the command line should be 'ahun', not 'aun'.

```
>#  update with subdirectories
>#DIRUP=aun//
```

Ditto for here.

```
>
>ARC=lharc
>#  update
>UPDATE=u -s -wf:\tmp
>#  update with subdirectories
>DIRUP=u -r2 -p -s -wf:\tmp
>
>GSOURCES=*.h *.c *.tlk *.s *.y make*.* memo
>
>backup:
>  $(ARC) $(DIRUP) arc\backup support doc lib header demo
>  $(ARC) $(UPDATE) arc\backup $(GSOURCES)
```

It's a good test (in a real-world sense), but to be fair to Zoo 2.1, it can compress files MUCH better than what this test has shown, along with being more compatible across platforms.

```
> Nat!
```

Later,
Dave C

This only works until the next time you save a desktop.inf
file from the desktop. The desktop seems to ignore the extra
lines when writing the file, at least when I tried it.
The best solution is Gemini, where you can do something
like *.[ALZ][RZO][CHO] in the instal application dialog. I'd
sure like to have Gemini run from a ROM cart.

F19, on North American TOS's had several annoying bugs, the worst
of which was that you'd suddenly find yourself flying inverted. Not
fun if you were 100 feet off the ground at 400 mph. ;-) After promising
to fix this for several months, Microprose announced that they didn't
consider North American sales significant enough to warrant the effort.
While the bugs may not be a major problem on European TOS's, the
early reports over here are that the game will barely run on most machines,
some only work if you don't touch the mouse, and 4 meg machines are
completely out of luck.
It's too bad, as this game's release for the ST was one reason I
put off purchasing a clone, as unlike Richard Covert, I consider the
386 boxes the current top games machine.

I pay high respect to your attitude, above all if I look on the products,
you have added to the PD-section on the ATARI. But you have to realize that
some people have to pay their rent with that money. Thomas is a student
and his university demand a high contribution. I don't know anything
about your profession but some people must earn money with their products.
>
>requesting the source, in this case, will save me the time of disassembling
>it, correcting the disassembled source, reformatting it, and annotating

If all people would thing think like that and every part of software would
be free of charge, we would not have so much professional software for
our computer. This might sound a bit fancy, but if I make a list of
professional products for the ST, the amount of them from germany would
perhaps be higher.(please don't get that wrong)

>i would not disassemble a spreadsheet, database, or any other sort of program.
>but for me, archivers are different.
>
But where do you make the difference ? OK, some hours against some weeks.

Bye......Michael

Message-ID: <1991Oct2.211237.20644@usenet.ins.cwru.edu>
Source record: 228359

In a previous article, boyd@bind.cs.fsu.edu (Mickey Boyd) says:

>Hey has anyone gotten the Delirious demo (two .msa files for one disk on
>atari.archive) to work? I have a virgin Mega2 with TOS 1.2. I tried twice.

Hmmmm, I'll have to try that one out!

>By the way, this and two other recently posted demos consist of two .msa files,
>one for tracks 1-40, the other for tracks 41-82. This means that the two
>.msa files map to one double-sided disk. The other two demos are "The
>Dark Side of the Spoon" and "Ooh Crikey Wot a Scorcher." Both are great! If
>you have a color monitor, you should check these out!

In the Dark Side of the Spoon demo, It locks up when I enter those array of
doors. How does your's react?

>Where does Manikin go to school, anyway?!?

MANCHESTER! (no explanation point needed)

BTW, did you try hitting reset? It's yet another demo. Also, on TLB demo,
don't bother trying to find the "Hidden Demo". You would need to hack
the demo to get to it.

Could someone break up the MSA to the two Care Bear demos?! I can't handle
such a big MSA. (Life's a Bitch demo and Whatta Heck Demo)

Not quite as simple as a "-target" switch; you need to build the complete
suite of programs.
>
> Has anyone else done this? Can I patch our existing compiler,
>or do I have to rebuild the whole compiler (I haven't really looked
>that deep into it yet).

You need the entire compiler, as well as GAS, the GNU assembler.

It would be nice to just configure the compiler for a number of
targets and select on the command line which target to generate
for. The gcc driver itself could be changed this way pretty easily,
but because of the way machine descriptions are handled it would be
kind of tough to make the code generation phases work this way.
>
> Also, where can I find unix sources for zoo, or does gnu-ST
>exist in tar format somewhere

I'd like Unix zoo 2.1 source too, been too lazy to go looking myself.

I am currently running gcc 1.40 on a sparc machine, SunOS 4.1, cross
compiling to my ST. You need to have the sparc version of gcc first
to compile the ST cross version. Then you need the cross version of gas
to actually put out ST object files. You can get the complete suite of
utilities from atari.archive.umich.edu - library, linker, includes, etc.

I'm a little hazy on the MiNT support in the current version of gcc.
It causes the mint libraries to be loaded before the regular libraries,
but the mint library docs say "use this instead of the regular gnu
libraries." Some agreement/clarification would be nice.

3188. lharc source...

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 22:53:13 UTC
From: rosenkra@convex.com
Message-ID: <1991Oct02.225313.29200@convex.com>
Source record: 228363

since i have received numerous requests for lharc 2.01e source in
anticipation of actually getting it, let me try and put an end to
these requests.

i have just received the source from thomas (infinite thanx, that
wasn't so hard now was it?). however, i also agreed that i would NOT
distribute this source, or any derivative source and i will abide
by that agreement. please don't bother asking me. i cannot and will
not post it or mail it or in any other way distribute it. i will ignore
all requests for same. i gave my word.

with that in mind, however, when/if i have time, i do intend to
return this particular version BACK to 100% C, in fact 100% portable
ANSI/POSIX (32-bit int) C. i will focus on the portions of the code
in assembler, returning them to C. i will profile the code (even
vectorize it!) and optimize the C performance as much as i care to
so that i will be satisfied with its performance. i will also fix
the bugs in it. this will not happen for several months. after that,
i will return this portable version to thomas for his own use. if he
chooses to release it, he can. if he chooses to continue that work,
i will applaud him. if he moves it to /dev/null, that is fine, too.

oh, and i'll go further: i will not post/mail/etc a BINARY ST version
either which would be as bad (actually worse). i might be persuaded,
however to distribute a convex executable image, if anyone out there
has a convex :-).

so, i guess i am happier now about the lharc situation. TQ's version
does seem to be the best version on the ST. and i will eventually
(finally) have a unix version to boot. henceforth, i shall retire
from most all public discussions on portability of archive formats.
i still don't think i can recommend lharc as a universal archiver,
but at least i have done something for myself to remedy some of the
problems i have with it. i still think at this point in time, zoo
is about the best overall archiving system available across the board
(i.e. independent of platform). a close second would be compressed
tar files, i think. then arc, and then possibly lharc. lharc _could_
rise to the top of my short list by having all lharc developers get
together and decide on a standard. i just don't ever see that happening.
i think someone mentioned that the amiga version also uses the lh4
format, which i am not sure 2.01e supports. so some amiga .lzh files
would not be extractable on an st. of course, at some future time, there
will probably be an new lh* format. then i am again back to bitching...

thank you all for your support during this effort. now we can proceed
with other issues :-)

Body handling: HTML body converted to readable text

You don't want to malloc in a desk acc inside a application, because once you are closed, anyone else can use that memory.
A easy Idea, might be to make savers written in some type of interpred language,or script. If you distribute an interpreter with it, literally anyone can make up their own saver...

To be really simple, the 'language' could just be an animation format...

sure, howard:

it took me a couple of tries myself. however, is is not too bad.
i think the makefile in the t100 terminal emulator i recently posted
has this. let's see if i can remember (for GCC 1.40, gmake 3.60, mint
lib PL 10, i think - gmake contains some of my own hacks to get it to
work for me):

# makefile from t100 (compiled for mint)
CC = gcc
OPT = -O
# -v=verbose, -Wall=all warnings, -z=errs to compile.err, -I->mint *.h
CFLAGS = -v -Wall -z -Ig:/mint/include $(OPT)
# -nostdlib is the key. also explicit crt0.o
LDSPECIAL = -nostdlib g:/mint/lib/crt0.o
# -L->mint *.olb
LDFLAGS = -v -Wall -z -Lg:/mint/lib $(LDSPECIAL)
# both gnu.olb and iio.olb must be specified as a byproduct of -nostdlib
LIBS32 = -lgnu -liio
LIBS16 = -lgnu16 -liio16
# if -mshort, use LIBS16...
LIBS = $(LIBS32)

TARGET = (your .ttp file here...)

OBJS = (your program .o files here...)

$(TARGET): $(OBJS)
$(CC) $(LDFLAGS) -o $(TARGET) $(OBJS) $(LIBS)

there is probably a better way, but something along this lines should work.
i keep "normal" gnu libraries and includes in g:/gcc/{lib,include}.

3191. C on the ST

Newsgroup: comp.sys.atari.st
Date: 1991-10-02 23:27:35 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1991Oct2.232735.5769@uokmax.ecn.uoknor.edu>
Source record: 228362

Okay, I've posted this question before, but I lost my reply file.

I'm looking to get C for my Mega 2, but I need something that can
be used from a floppy based system (I have to DS/DD drives).

Is Sozobon any good? Will it work with the above condition?

I bought called 'A Book on C' by ??? and Ira Pohl. It seems to have
quite a good discussion on C (for IBM/Unix systems :( ), but I couldn't
find anything about how to check the mouse or anything about graphics.

Is there an Atari specific book that talks about this?

Oh yeah, I want to convert a BASIC program to C, but I need to know how
to do PEEKs and POKEs in C.

I'm not sure what the ST Basic command "vdisys(1)" does, but I gather
it has something to do with the mouse (based on the context of the
program). What the "chain" command is and how it works would also be
nice to know.

Please respond by e-mail as I don't keep up with this newsgroup on a
regular basis (messages are gone in 2 days around here and I read
r.g.frp, r.a.startrek, and r.a.drwho before this one).

Thanks in advance,
Kenneth Love

3194. SST for 1040STe's ??

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 03:29:46 UTC
From: longj@lonex.rl.af.mil
Message-ID: <1991Oct3.032946.6217@lonex.rl.af.mil>
Source record: 228364

Can anyone tell me if Dave Small will make a version of the
SST that will work with 1040STe's?? I remember reading something about
it several months ago, something to the effect that if STe sales
warranted, then an adaptor to connect to the square 68000 in STe's.

I sure hope the answer is yes! I am about ready to upgrade somehow, and
the thought of being able to get an '030 box that might be able to run
UNIX and still have my beloved atari stuff close at hand is
intoxicating!!

If yes, when and about how much will such a beast set me back?

>I'm a little hazy on the MiNT support in the current version of gcc.
>It causes the mint libraries to be loaded before the regular libraries,
>but the mint library docs say "use this instead of the regular gnu
>libraries." Some agreement/clarification would be nice.

The mint library docs were written before gcc 1.40 was available and before the gcc include files were adapted for MiNT (you can check the latter by grep'ing for __MINT__ in the include directory), so the confusion is understandable. Some clarification, then:

(1) You can keep the original gcc include files and libraries, and name the MiNT libraries as mint.olb and mint16.olb, and then use the "-mint" switch to gcc to use the MiNT libraries (e.g. gcc -mint foo.c). If you do this, the MiNT library will be searched first, and then the "normal" gcc library; it is highly unlikely that anything will actually be linked from the normal library, since the MiNT one is complete, so that second search does nothing. (Also: use the gcc library crt0.o).

You can use this set up if you want to use different libraries for different programs.

(2) Alternatively, you can throw out (or put on a backup disk) the old gcc libraries and use the MiNT ones (in this case, call them gnu.olb and gnu16.olb) and the MiNT crt0.o. In this case, you'll probably want to use the MiNT include files instead of the gcc ones, since they're smaller.

This is the setup I use, and it's the only one I can absolutely guarantee; on the other hand, I strongly suspect that (1) works as it should, since I trust bammi to get it right. Personally, I can see no reason *not* to use the MiNT library alone, so I see no reason to keep the "normal" one. However, mileage may vary.

(Do I see a reason not to use the normal library? Yes: UNIXMODE is a horrible abomination that causes code bloat and aggravation if you're trying to use a non-TOS file system (like minix) under MiNT. It was probably one of my worst ideas (or, if the idea wasn't bad, the implementation certainly was). MiNT is my penance for UNIXMODE :-)).

I'm tired of using Video Key with a composite monitor. It was an inexpensive option at the time, but I would like to get the real thing now.

Does anyone have any suggestions for a color monitor purchase? Any warnings?

BTW, this is for a 1040 STf.....

3198. KR2ANSI

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 05:55:56 UTC
From: harryk@bucsf.bu.edu
Message-ID: <90870@bu.edu>
Source record: 228367

I just put kr2ansi.zoo on atari.archive. kr2ansi is a small utility that generates ANSI prototypes from K&R-style C source files.

Using output redirection one can generate header files (the program puts an "extern" in front of every prototype line) with prototypes of all the functions present in the file read...with the appropriate #include lines in the K&R source code old-fashioned programs can be compiled with an ANSI compiler (thus taking advantage of the parameter-checking during compilation).

If there's enough interest I can also send it to c.b.a.s and c.s.a.s

have fun...

cjherborth@rose.waterloo.edu (Chris Herborth) writes:
>a) What's the problem with Malloc() inside an ACC? Beyond the possibility
> of fragmenting your memeory, I can't imagine anything going wrong...

Like I said, when you malloc memory from an acc, the memory belongs to the
current process not the accessory. So if you are in an application when you
malloc some memory, you'll lose it when that application terminates. The
desktop doesn't terminate so you should do your mallocing then.
I'm not sure about rez changes though. Perhaps the desktop 'quits' then.
I guess you'd have to catch that.

>The main point is, it's to be an EXTENSIBLE Screen Saver. You could have
>2M of modules sitting in your XScreen folder (well, if it caught on and
>lots of people wrote modules) and you wouldn't want to load them all when
>you booted. You'd just want to load the one that was going to be
>executed when the screen saver went off. When you were done (ie, work your
>ST back up), it'd get deallocated.

What I described was an EXTENSIBLE system. You might have to reserve memory
for saver slots in advance though.

>There's another problem --> I haven't got the assembler smarts to write
>any sort of code that'll relocate and execure a module the way you
>suggest, with a special header/whatnot. I can't even use XBRA without
>the routines somebody else wrote and uploaded to a.a...

Well you are going to have to learn about assembler anyway to write
the saver in the first place.

BTW I'm getting all this stuff in reverse so I'm replying without having
seen Ken's message yet. No doubt I've made some more screw-ups! :-)

From: DE7B@br1.hrz.th-darmstadt.de
Message-ID: <1991Oct03.132541.22718@infoserver.th-darmstadt.de>
Source record: 228384

As two people have pointed out I lost 'cause I oversaw the 'h' option
on Zoo 2.1. I ran the tests again and sure enough the results of ZOO
came very close to Lharc. Which makes conclusion wise ZOO as good
as Lharc really.

As to the fragmentation issue, I don't still quite see the problem (but
who cares ? (har)) since after erasing the produced files, the fragmen-
tation ought to be the same as before (the allocated blocks being freed).
BTW. Since all archivers ran on the same partition from the same /bin
directory I don't see this comparable to running one from a floppy and
one from a ramdisk, not even in a more transcendental sense.

Oh well
Nat!

3202. Large disk partitions

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 13:57:58 UTC
From: jgj@ssd.csd.harris.com
Message-ID: <JGJ.91Oct3085758@rcx1.ssd.csd.harris.com>
Source record: 228395

I am thinking of repartitioning my Megafile 30 to have just one partition, but I am concerned that this will break my disk cache program (dcache). Will dache work with sectors larger than 512 bytes? Is there a cache that will? Also, is there a print buffer that will work with 1.4 TOS ROMS? The one I used to use, MegaMatic, doesn't.

I found numerous caches adn buffers on atari.archive.umich.edu, but would like to avoid having to try each and every one. I can't even look at the docs for some of them since they are in lzh format and there appears to be *no* unix version of this program on the planet. What was wrong with good old arc? It worked on every machine in the world (except Mac, which nothing works with). Now we have a thousand different lharc formats on each machine, except unix, where we have none. I finally got an lharc on my ST, but it requires all the folders it is going to extract into to already be there. Ugh. What absolute trash. Enough ranting and raving.

Thanx in advance.

>Karl Anders Oygard - Karl A Oygard <data3d@aahs.no>

System 7 does not work as yet (and who wants it, have you used it? Man, talk
about slow. Also uses over a MEG or ram just for the basic OS, they probably
have Crays running on smaller operating systems. I have a theory the whole
thing was written in basic, and is actually just a huge pracitical joke
anyway). I don't know about A/UX. Dave Small will probably have system 7
working soon for those who want it. As for A/UX, since Dave is a UNIX wiz, if
it does not work at this time, I'm sure he is working on it, or can at least
let you know one way or the other.

I found when using ZOO V2.1 from my backup program (which can use any
compression utility) that ZOO V2.1 still wasn't completely error free.

Unfourtunately I don't remember what the implications were, but since then
I use LHarc. Both ZOO and LHarc are the only, known to me, which accepts
hidden and system files so for me that's the only choice.

Also note that the earlier LHarc V2.01? versions quite a lot of bugs which
could trash compressed data.

thank you. my contention all along :-).

>As to the fragmentation issue, I don't still quite see the problem (but
>who cares ? (har)) since after erasing the produced files, the fragmen-

if you are satisfied that this is not an issue, fine. but if you found
gross differences in performance, i would question this. if you try another
test, say wipe a 5 MB partition clean and time the copy of a 500KB file
to it. then fill the partition with 1KB files and randomly delete about
20% of them and time the copy again, you will see significant time
difference. this is because in the first case, all the new clusters would
be contiguous and the head motion would be minimized. in the second case,
the head would be moving far more since (i think) the new file would be
copied in chunks to the first available clusters (which are scattered all
over the disk). this is especially bad if your HD has 65 ms access. it
may not be too bad if you have a < 28 ms access mechanism. i was just
trying to eliminate any possible differences in performance attributed
to the environment and making it possible for the results to be reproduced
by others. it would appear that lharc and zoo do i/o similarly, so this is
(in this case) not a big deal as you found out. in other situations, however,
this may not be the case. it gets even worse as partition size increases
IMHExperience.

again, thanx for taking the time to correct this...

^^^^^^^^^^^^^

OOPS! You also have to rename the crt0.o from the MiNT library to
mcrt0.o and put it with the libraries; it'll get linked if you use the
-mint switch, *instead of* the normal crt0.o. Sorry about providing
that object lesson in the dangers of sleep deprivation :-).

I think the rest of the summary is correct. To recap, if you want to
keep both libraries on line:

(1) Rename the MiNT library crt0.o to mcrt0.o. Put it with your other
library stuff.

(2) Rename the MiNT library gnu.olb and gnu16.olb to mint.olb and
mint16.olb, respectively. Put them with your other "normal" gnu.olb
and gnu16.olb.

(3) To use the MiNT libraries, compile with -mint. To use the normal
libraries, just compile normally.

(4) Programs compiled with the MiNT library still work under TOS, so it's
also perfectly reasonable to just copy the MiNT libraries over top of
the "normal" ones. If you do this, you *must* use the MiNT include
files as well (or always put -D__MINT__ on the command line; the old
include files need this define, which -mint automatically provides, in
order to work with the MiNT library).

The flip side of this is rewriting ANSI-style definitions and prototypes
for a K&R compiler. A program that does just that, unproto, was posted
recently to comp.sources.misc. I compiled it with Sozobon in about
15 minutes and it works just fine, so far as I can tell. I had to comment
out a feature that inserts line numbers (presumably for the benefit of
some Unix compiler; Sozobon barfs on them).

3210. Recent version of Diablo Driver wanted

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 16:58:09 UTC
From: cordes@ac.dal.ca
Message-ID: <1991Oct3.135809.1497@ac.dal.ca>
Source record: 228388

The Atari Laser printer (SLM804) comes with a Diablo driver (diab630.prg) and an accompanying setup accessory (setup630.acc). My version of setup630 is 1.2 and I understand that the most recent version is (at least?) 1.4, so I wondered if some kind soul would be willing to post the more recent version to the atari.archives (or mail to me, and I can post). I don't know if the driver has gone upgrades as well, but it seems probable. Presumably someone with v1.4 of setup630 likely has a more recent driver also. Thanks very much,

3211. SuperCharger PC emulator specs

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 17:33:21 UTC
From: bferrer@Bonnie.ICS.UCI.EDU
Message-ID: <9110031033.aa16009@Bonnie.ics.uci.edu>
Source record: 228386

Can someone please email or post specs on the SuperCharger PC emulator?
Does it emulate a 286 or 386? How many slots does it have? Can I put a VGA board in the slot and use a multisync monitor?

thanks in advance,

Bill
bferrer@bonnie.ics.uci.edu

3212. Non-atari monochrome monitor

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 17:56:39 UTC

Message-ID: <mrgnstrn.686512599@yorku.ca>
Source record: 228391
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can another, more commonly-available and cheaper type of monochrome monitor be used with an Atari ST in place of the Atari monochrome in the ST's monochrome video mode? If so, how?

Thanks!

Stephanie Morgenstern
mrgnstrn@nexus.yorku.ca

This solves your personal problem, but it doesn't solve the problem for the rest of us of not having a Unix version available.

The present situation can be summarized simply: zoo 2.1 and lharc 2.01e are roughly comparable in both speed and compression. However, sources are available for zoo, and it is easy to bring up under Unix. Sources are not readily available for lharc 2.01e, and it doesn't presently run under Unix. All other considerations are secondary (command line format, choice of defaults, documentation, and so forth). I would urge that archives not be accepted unless they are in a format for which a portable unpacker at least is publicly available.

>difference.
Yup, but you wouldn't do that inbetween your test stages ? If on a
singletasking GEMDOS system you delete the produced files, you have
the same fragmentation as when you started producing those files. So
the overall time is affected yes, but not the relative time (for this
test environment).

>... i was just
>trying to eliminate any possible differences in performance attributed
>to the environment and making it possible for the results to be reproduced
>by others. it would appear that lharc and zoo do i/o similarly, so this is
>(in this case) not a big deal as you found out. in other situations, however,
>this may not be the case. it gets even worse as partition size increases
>IMHExperience.
But the point of my (failed) tests wasn't to establish a byte/second
measurement, but a relative measurement. So I wasn't trying to deduce
that lharcing 700KB worth of ASCII will always take 6 minutes or whatever
on a 8Mhz ST. A programs performance is not just raw CPU time but also
I/O. The cleverer the buffering strategies and the less i/o done (in
most cases) the better. If you just do I/O on ideal devices (clean RAMdisk),
you are punishing programs who use more clever i/o in order to circumvent
the ususal everyday pitfalls.

Worst case scenario:
Lets say one program "stupid.prg" does something very dumb
I/O wise, like reading in a file two times, chances are that on your every
day slow device, that program seems to be crawling, wheras on a RAMdisk
that program might even perform better than a more sophisticated one (i/o
wise).
..Assuming that stupid.prg's algorithm is otherwise much better. (playing
devil's advocat here, but hey who started this ? (har)).
As devices get faster, I/O importance lessens.

BTW: A better test would be to setup partitions of various sizes and fragmen-
tation on several different devices and then do the tests again

(just in theory, who's got the time..) - and - Just because a result is reproducable, doesn't make it automatically the most meaningful result.

Anyway

>functions present in the file read...with the appropriate #include lines in
>the K&R source code old-fashioned programs can be compiled with an ANSI
>compiler (thus taking advantage of the parameter-checking during compilation).

Unfortunately, I've found that just using the prototypes is not enough. The
actual function declarations must also be the exact same as the prototype.
e.g., if you have a prototype:

```
int foo(char bar, int baz);
```

then an old-style function declaration of

```
int
foo(bar, baz)
char bar;
int baz; { }
```

causes a prototype mismatch. (The old-style declaration seems to imply
promoting the char to an int, and so the prototype needs to be changed to
int as well, or the declaration needs to be fixed...)

I've seen some code that does stuff like

```
#ifdef __ANSI__
#define __ARGS(x) x
#else
#define __ARGS(x) ()
#endif
```

to allow compiling stuff with or without prototypes, but nothing is done
to address the problem of matching the function declarations. I've created
some macros to handle this but they're pretty limited and can't handle any
fancy declarations, like arrays or function pointers...

3216. ZOOSHELL 0.6

Newsgroup: comp.sys.atari.st
Date: 1991-10-03 20:06:40 UTC
From: steve@thelake.mn.org
Message-ID: <A2027165507@thelake.mn.org>
Source record: 228396
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently shipped ZOOSHELL 0.6 off to atari.archive.umich.edu, and (naturally) a bug surfaced quite quickly. The bug is fairly obvious in the code, which also is available at a.a., so if you have Sozobon C and want to fix it, change the following in main():

```
strcpy(zoottp,p);
```

to

```
if (p != NULL)
strcpy(zoottp,p);
```

This bug surfaces only if ZOOSHELL can't find ZOO.TTP in the current directory or with a PATH search. If you use an environment-setting utility (which I wholeheartedly recommend for Desktop users) you'll never encounter this one.

I intend to release a newer version of ZOOSHELL, but at the moment I'm bogged down in the process of writing ARGV-compatible startup and process-control code so that ZOOSHELL can pass very long arguments to ZOO. (I also am doomed to work for a living, which interferes with recreational pursuits.)

>most cases) the better. If you just do I/O on ideal devices (clean RAMdisk),
>you are punishing programs who use more clever i/o in order to circumvent
>the ususal everyday pitfalls.

yes. agreed. and i did eliminate this from the test as well, tho not for
the reasons that people thought ("he hates lharc so he wants to make sure
zoo wins"). you are correct that a comprehensive test would have sought out
these strategies as a desirable trait. i did mention this in the original
post as well. my hypothesis going into the test was that both were going
to be pretty equal on all fronts. my evidence was that zoo was compiled
with GNU C by someone whose previous (excellent) work i was familiar and
that lharc was well tuned by conversion to assembler.

to be fair to me, however, and those with similar situations, i generally
either extract a new archive into a ramdisk to "check it out" or when
creating an archive of something on hard disk i write to an archive file
in ramdisk. in both cases, which constitues maybe 75% of my archiving,
maybe more, the only cleaverness is how the original files are read and
the disposition of any temporary files (i.e. is the program smart enuf
to recognize i am ususally smart enuf to make $TEMP a ramdisk?). i think
the fact that your equally limited tests, tho perhaps more realistic for
your particular use, shows little difference implies that as far as IO
is concerned, both are about as smart (or dumb). i suspect smart because
i know of at least one tiny modification (which bill shroka did in fact
do) which improves zoo's performance. i have not had a chance to examine
lharc, tho i suspect it handles things pretty much the same.

>As devices get faster, I/O importance lessens.

another important point which can be broadened futher: as cpu's get faster,
archiver tuning lessens in importance. as disks and communications get cheaper
and faster, compression ratio lessens in importance.

>BTW: A better test would be to setup partitions of various sizes and fragmen-
>tation on several different devices and then do the tests again
>(just in theory, who's got the time..) - and - Just because a result is repro-
>ducable, doesn't make it automatically the most meaningful result.

yes, but it DOES make it reproducable, in itself desirable over something
both non-meaningful and non-reproducable. one is subjective, the other
objective. your definition of meaningful may not be meaningful to someone
else. and even if it were, if it could not be reproduced, it would resort

to hearsay.

there are ALWAYS better tests. i think mine was fair for what i did. i tried to point out some of the weaknesses in the test that i saw. and i think that there can be no question that it is valid if all your archiving is done in ramdisk. except that i did not necessarily use "calibrated" files. i did, however, give a source for the files at least in one of the tests (portions of the MiNT distribution) so it could be reproduced.

That was my guess, from seeing the "Blitter" option greyed out (ie. disabled)
on my friend's TT. It seems to me that if TurboST and QuickST can do better
than the blitter (though I'm still not convinced), then certainly even the
coders at Atari can do better with a 32MHz machine.

3224. CAPTIVE help needed: Salstee (base 5)

Newsgroup: comp.sys.atari.st
Date: 1991-10-04 02:37:54 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <1991Oct3.213754.34070@kuhub.cc.ukans.edu>
Source record: 228409
Cross-posted to: rec.games.misc,comp.sys.atari.st

Howdy! I play Captive on the ST, and don't see much net mail discussing the game - but I'll try anyway. I've come to an impasse in the 5th base (Salstee), and I need a pointer or two to get any further with the game. The entrance is in the upper left of level II, and this level is very large. There is a small level I, accessible only by an elevator, and the generators are down there. There is also a small level III, and the ladder going up to it is in the lower far right of level II. Okay so far? Well, the ladder leads up to one room on level III, and there is another ladder down to L II. However, the map for L III clearly shows several other rooms, one of which is in the lower right corner - yet there are no apparent connections between the room the ladder comes up into and these other areas. The *one* suspicious spot is this tiny little space (1 by 1 unit) on L II, close to the other ladder up - which is also visible on the map, but with no apparent means of access. I suspect there is another ladder in this space, and that it leads up to the other rooms in L III. I need to get in there, to get the password for the probe on LII, and to get another probe. The only reason I can think of that I might not be able to get in is that the game may keep track of how far your droids have progressed, and *intentionally* deny access if you've made too much headway. That's only a theory, however. I'll be immensely grateful for any help or hints - heck, just hearing from someone else who plays this game would be a wonderful surprise! Cheers,

What does it take to convince you that TurboST et al do better than the
blitter? A simple comparison of a non-blitter machine vs. a blitter
machine (no TurboST or QuickST allowed!) is all that should be needed
to convince anyone! There simply is no really noticeable difference!

The Atari blitter was (and is) a joke from day one. I can still remember
Neil Harris promising that Atari would offer a blitter upgrade to existing
ST's and how eagerly we waited and waited and waited for that promise to
become simply another piece of Atari vaporware. However after seeing how
little the blitter does performance-wise (other than making a few demos
speed up!) I can honestly say that's one promise better off broken!

If you want to see a REAL blitter in action, check out an Amiga!

From: Philip.Durgin@fquest.FidoNet.Org
Message-ID: <686575281.1@fquest.FidoNet>
Source record: 228438

I did my own research between ZOO 2.1 and LHarc 2.01E and found the following.

1) Hacker.txt 10232
2) hacker.prg 124698

This is an on-line game for my BBS was compress with both ZOO and LHARC

LHarc: 64089 bytes in size after compression taking 55 seconds to do so.
ZOO : 88312 bytes in size after compression taking 47 seconds to do so.

both took 15 secs to extract the files.

Compressing a .GIF picture named ARMY1.gif 168010

164078 after LHarc compression
220107 after ZOO compression

If being able to compress files 73% smaller than ZOO is not a significant difference then you must have HD space to burn.... And not being to Compress a .GIF picture at all is unthinkable. I guess I am going to stay with LHARC until ZOO can show a much better track record than the one available.

I do not agree with you. As far as I know you can disable burst mode by
hardware. That means if the processor always tries to access in burst mode
(regardless of ST or TT ram) the hardware decides if burst mode is really
available. I think the 68030 in the TT always uses burst fills. When
accessing ST ram the hardware disables this mode but with TT ram it is active.
Am I right? I hope so.

>This is true? Then if a program Mallocs memory for use as a displayable
>screen, it will have to malloc from ST ram, right? How does one ensure
>this?

You are perfectly right. There are two ways to make sure that a program
gets ST ram when it mallocs.
1. There is a bit in the program header telling TOS which kind of
ram this program will get when it uses the normal MALLOC call. This is important
for programs which do not "know" the TT and malloc memory for communication
with ST-compatible hardware (ACSI) or for the video screen.
2. Starting with the newest TOS versions (on MegaSTE and TT) there is a new
call MXALLOC which allows to specify the kind of ram you need. Programs
which need to use ST ram for special purposes use this call to get the
appropriate memory type. In this case the malloc bit in the program header
has no importance.
If you write your own software and if you have to care about the different
types of ram you have to use the MXALLOC call to ensure that your programs
work correctly on the TT.

No, that's right. The TT has no blitter, indeed. Because of the 68030 barrel shifter bit manipulations are _much_ faster than with a 68000. So there is no need for a blitter.

Anyone know where to find a C++ compiler for the ST? I've been working with C++ on PC's for a while and badly want to be able to use the ST with a C++ compiler. Has GCC++ been ported yet, if so where do I find it? Also, if it has been ported, does it run under MiNT? (And where do I find MiNT!)

There seems to be trouble with the computer I'm using here, but I have received answer from outta space. So just go ahead and mail me

I *love* my ST!(

Plexus Productions TeX/Metafont Release v2.0 (P^D TeX v2.0)

I have recently complied all the TeX and Metafont stuff I could
get my hands on into a coherent and well formed distribution. The system
is available on about 24 double-sided disks for the Atari ST. It included:
TeX 2.9 (3.1 would've been nice but I could get little support from
the author)
this included Plain tex, LaTeX, PicTeX (pictures), MuTeX (music),
Initex, texinfo, 'A Gentle Introduction to TeX' (a good starter
manual), BibTex, Tex\Latex\Pictex\Bibtex etc input files.
TeX Draw which allows you to WYSIWYG draw and output the picture
in Latex, Pictex format.
Competent dvi viewers and printers including utilities and fonts
and a DVI to Postscript converter
Metafont with complete font sources for CM, AMS Euler and Cyrilic,
LaTeX, MuTeX, Wasy and Pandora fonts. also inimf and other
utility files
Ten disks filled with fonts

all files are unarced and properly foldered. I am including a hardcopy
laser printed copy of 'A Gentle Introduction to TeX' and well as relevant
DVI, etc docs. I al also including a manual describing the files and
which ones you need to install for particular requirements.
The distribution is available for $75 Canadian. This pays for the disks
(24 of so) and a bit for the time it took to compile the distribution.
You also get my support. If you want more info or would like to order,
please write to:

The way I see it, if you're using the MiNT library (please, everyone, do so :-)
you should not even need the old library. I certainly haven't got it...

Which libraries have been used to build the binaries of gcc 1.40 available at
a.a? (I'm still on 1.39, unfortunately.)

3238. GDOS question

Newsgroup: comp.sys.atari.st
Date: 1991-10-04 12:34:31 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Oct4.123431.22611@echo.philips.nl>
Source record: 228422

Hi,

Until recently I never used GDOS, but last week I bought a cheap
DTP program to find out how it works. It uses GDOS.

I installed it on my hard disk of my MEGA STE.
Copied GDOS in the AUTO folder of the hard disk (drive C: ofcourse).
Copied the fonts to the C:\FONTS directory.
Copied the ASSIGN.SYS file to the root directory of drive C:
(Note that drive C: is the boot drive on the MEGA STE).

One thing puzzles me.

Since I did this, at boot time the computer inspects drive A:
(after presenting the normal desktop)
but as I never have a floppy in it, I get an error message.
After aborting the operation (or so), by means of clicking
on the appropriate button of the alert box which tells me
about drive a:, everything works fine:
The program works, prints correctly and so on.

(OF course I changed the path name in the assign.sys file
to C:\FONTS).

So my question:

1. WHY is drive a: being inspected (by GDOS I asume)?

2. How can I avoid drive a: being inspected?

3. Who can point me to GDOS documentation?
(note that I can not use ftp, only email)

Thanks in advance,

john

3239. GCR disk problems PLEASE HELP

Newsgroup: comp.sys.atari.st
Date: 1991-10-04 12:50:41 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Oct4.125041.23097@newcastle.ac.uk>
Source record: 228182

I have just obtained a GCR but am having trouble trying to get it to read disks formatted on a Mac. I managed to install a system 6.0.4 from the disks but MS word would not copy of the floppy reporting the disk damaged.

I ran GCRTEST.PRG to investigate further.

I first ran a complete test on a blank disk. Which went without a hitch. The next step in my investigation was to do a read test on the faulty disks. This showed a few bad sectors mainly in the 8sec/track column on the Word disk and to my supprise the system disks as well. (I assume the programs just wern't stored on this part of this part of the disk.) I also tried the same test on my external floppy but recieved more errors than before.

In an attempt to solve the problem I first tried adjusting the pot in the GCR but this only seemed to make matters worse.

So assuming the problem was shielding I tried wrapping the internal floppy ribbon cable, power cable and drive in some Aluminium Foil. This again did not make any differance.

Attacking the proble from another angle I tried to format a blank disk on a real mac and transfer the Word program to this new disk. When this disk was tried on the GCR it gave even more errors than the original. (Both disks read fine on a number of Macs). Could the increase in errors (which now start at the 10sec/track column) be attibuted to the mac using a HD drive?

Finally the last thing I could think of trying was to format the disk with the GCR and transfer the software to this disk on the mac. You gessed it lots of errors again.

Summary of methods tried with/without foil wrapping and with adjustments of the pot in the GCR.

Comlete test (Format/write/read etc.) All checks out ok
Read Test (Original Disks.) A few errors on 8/track column
Read Test (Copyed by mac & mac fmnt) Errors from 10/track column
Read Test (Copyed by mac & gcr frmt) Errors from 10/track column

To eliminate the Mac from the problem hunting I tried two of them in the above tests with no apreciable differance in the results.

If it makes any differance the machine I am using is a 2Meg STe with an ICD base HD system and SM124 (NB internal and external floppies are made by Sony.)

I am after any hints on this as I think the GCR is a great piece of
kit but not being able to read original mac disks is a real pain.

I hope someone can help

Dave.

This seems to be generally true. I could never really notice a difference in most software. However, with the ISAAC card, the blitter does make a HUGE difference. Actually, to get a fast enough machine with ISAAC I have the blitter, AdSpeed, and Quick ST. It may be that the smaller stock resolutions just don't require much speed-up anyway, and so the blitter has little noticable effect (but you can notice it, just not by much). With a big-screen it produces a signifigant difference. Um, just for reference, how does one turn off the Amiga blitter? I will check it out next time I'm in the store, though to tell you the truth, I can't really see much difference in speed between the two machines (when running at approx. equal speeds) anyway, they seem to be fairly neck and neck in this regard.

I'm posting rather than replying by email because I think this might be of use to many people.

There is a shareware product which can convert between all the formats you mentioned and some others as well, including the .RLE compressed bitmaps you need for Windows startup logos. It is a Windows program called PaintShop and is available on cica.

A local MegaSTe owner wants to know if there are any large monitor graphics cards for the MegaSTe.

Re: the person who posted about Pagestream and the SLM laser. I have an SLM605 and the Rev A Diablo Emulator and have had no problems with either Pagestream 1.82 or PAgestream 2.1. The only gripe I have is that Pagestream prints to the SLM605 at a fraction of the speed Calamus does. I am impatiently waiting for Calamus S. While I find Pagestream easier to use than Calamus 1.09N, Pagestream has always been VERY slow to print (I use it on an HP/Pacific Page postscript system as well as the SLM605). For PURE, RAW speed, Calamus and the SLM605 is the ticket to hyperwarp!!!

This is not empty pro Atari dribble; I use 80486/33Mhz systems with postscript and they cannot match an 8 MHz MegaST with an SLM laser!

3244. News on TT Unix...

Newsgroup: comp.sys.atari.st

Message-ID: <"1043*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228421

I spoke with Atari Norway today, and (incredible though it may seem) they were able to give me some information on the TT Unix.

Existing owners of Atari TTs may purchase Unix for around 15000NOK (divide by app 6.5 for price in dollars, 11 for GBP). The unix comes in shape of a readily installed 210 meg harddrive. The unix is system 5 compatible and comes with xwindows and a lot more.

The people behind the TT Unix is supposedly the same team that ported the only existing unix on the Apple Macintosh. The story behind A/UX goes something like this: As the original developers were starting to see the end of porting unix to the Max, Apple bought the project in its entirety, and, quote, rewrote it and ruined it completely.

The unix is very stable, and compared to the Apples pathetic A/UX and the rather buggy unix that Commodore deliver with their 3000UX, the TT Unix is a clear winner. Whether it will run in conjunction with an SST '030 board is unknow as of yet.

ALBERT is the ISAAC card for the MegaSTe, it is the only one I now of. I have
ISAAC which works well, but the settup is a pain in the a*s.

The Calamus SL demo I have prints CONSIDERABLY faster than Calamus 1.09N!

Got it sorted working on a Mega STe, it will give 3 or 4 bombs at the 1st read after cold boot, reset it and touch the space bar in the second boot then it would shows the message and the fly bounce out O and a digitized voice comes out then the loading of demo. Unfortunely the Color monitor I tried can't sync. with it so the screen just keep scrolling. Will try again with the monitor adjusted to see whether it works. And it won't boot from the 1040ST with TOS1.2 so probably it needs STE type machine.

Looks like you don't know much about TOS 1.4. I don't know about anything different between the DESKTOP on both TOS versions. But I do know about some very interesting speed increases of disk access, especially on a hard drive. Also I know of some new function call, that are quite nice. Some other routines inside of the memory manager are fixed. I think that these are very good reasens for a change.

Atari 520 ST with, external drive(ssdd), mono monitor,
system disks, and various software (tell me what you
are looking for).

Software that might be of interest to some :
- 1st word word processor
- Uniterm vt100 term program w/ xmodem/kermit
- protocols and tektronic graphics emulation
- Hippo C compiler
- Degas , publishing/paint program
- Asmpro ,a 68000 assembler.

external 1200 baud modem with cable and manual

asking $300 , or best offer (price includes shipping).

As a last resort , I will split up the system but, the
prices may be less negotiable. I used it as a general
purpose machine in college and it served me well. I
am now selling it because I have a 386 system.

Thanks

Golando.

3251. Monochrome pictures

Newsgroup: comp.sys.atari.st
Date: 1991-10-04 22:47:13 UTC
From: cjherborth@rose.uwaterloo.ca
Message-ID: <1991Oct4.224713.24324@watdragon.waterloo.edu>
Source record: 228450

To start an almost completely useless thread:

Does anyone know of a decent source for good monochrome 640x400 images
(.GIF, Degas, .IMG, whatever) that would be suitable for background pictures
on my desktop? I've got this really great rendition of the cover from
Jean Michel Jarre's Oxygene album, but I'm getting a little sick of it...

In case you're curious, I think I downloaded it from GEnie...

3252. HP Laserjet IIIP

Newsgroup: comp.sys.atari.st
Date: 1991-10-05 00:23:06 UTC
From: sap@sactoh0.sac.ca.us
Message-ID: <1991Oct5.002306.7446@sactoh0.sac.ca.us>
Source record: 228428

What is involved in hooking up an HP Laserjet IIIP to my computer? Are there any features I would not be able to take advantage of? What about fonts? Will the new GDOS work well with it? I have Pagestream and WordPerfect (which both have drivers for Laserjets), how well do these work? What about the options for the printer (i.e. toner cartridges, font cards, memory upgrades, etc.)?

Thanks in advance,
Stephan A. Puga

3253. UK ST stuff

Newsgroup: comp.sys.atari.st
Date: 1991-10-05 06:30:22 UTC
From: boyd@bind.cs.fsu.edu
Message-ID: <1991Oct5.023023.7129@mailer.cc.fsu.edu>
Source record: 228432

Hey folks,

A buddy of mine just came back from a summer in England with an
armload of ST mags. After reading them all, I must say I envy those folks.
Lots and lots of neat ST hardware and software. Some notables that jumped
out at me:

Sun style optical mice, for you real masochists
A memory board that allows one to use SIMMs in any ST (!)
Many monitor options, including a full page mono.
Lots of scanners and professional DTP utilities.
About a zillion great looking games, including a completely
rewritten Populous 2.

I also noticed that hard disks seem to be VERY expensive, with the ICD
FaST products being very popular. Neodesk and the Codehead suite seem to
be tops in their class (nice to know us yanks are good for something). Dave
Small and the Spectre GCR are also getting lots of attention (several of the
mags have rather tongue-in-cheek recommendations for mac software). Each of
the magazines came with a disk. They all contained at least one demo of a
commerical game, and lots of other goodies including source code for various
graphic thingies, Uniterm (2.0c, which is billed as "hot out of the programmers
hands", sheesh), and the full commercial version of TCB Soundtracker with docs.
Also, to give the readers something to assemble the included source with,
Devpack v1 is included on one of the disks. All in all, I am impressed at the
quality of the mags. They are about 70% game oriented (thats ok, I play games
about 70% of the time :-), the rest being programming tutorials and
professional reviews/tutorials. I know Sideline Software in Florida offers
stateside subscriptions to these magazines. After seeing a bunch of them, I
just might try one out for a year (kind of expensive, with the disk and all).
Anyway, for those bemoaning the lack of "glossy" mags for the ST, you need only
call SS's 1-800 number.

I might have to order one of those memory boards also. An unpopulated one
costs 59 pounds. SIMMS seem to be cheaper here also.

>I am not completely happy (who is?) with it.
>Is mint better? what about minix?

You might try the Okami shell (from atari.archive). It is very nice, but
you have to try to figure it out (unless you can read German). It is not
to hard, and there is some minimal english documentation. It is like gulam
in that it is just a shell, not a complete OS replacement.

>Also am unhappy with my C compiler, "laser C",
>it doesn't do some things that ANY C compiler
>should. Such as:

I am very very happy with Prospero C. You might (being a unix guy) try out
gcc from atari.archive.

3258. Re: Install an app for two diff filetypes, term with IBM graphics option?

Newsgroup: comp.sys.atari.st
Date: 1991-10-05 15:45:21 UTC
From: as666@cleveland.Freenet.Edu
Message-ID: <1991Oct5.154521.2772@usenet.ins.cwru.edu>
Source record: 228440

```
-----
1. Is there anyway to install an application for more than one filetype?
I was wanting to install ARCGSHL 3.5 for both ZOO and ARC, and under TOS
1.0 I could just go up to install on the menu twice, once for each
filetype. Well, it won't let you do that under 1.4 :*( So I tried to
edit the desktop.inf file adding the required lines to install the
application for two filetypes. Well, my ST just crashed on boot up
then!! Any suggestions?
---

I suggest you try again...Here's the part of my DESKTOP.INF file that
relates to your problem. I did this with a text editor...

#G 03 04 C:\UTILITY\STENO.PRG@ *.SYS@
#G 03 04 C:\UTILITY\STENO.PRG@ *.ASC@
#G 03 04 C:\UTILITY\STENO.PRG@ *.MNU@
#G 03 04 C:\UTILITY\STENO.PRG@ *.HLP@
#G 03 04 C:\UTILITY\STENO.PRG@ *.BLB@
#G 03 04 C:\UTILITY\STENO.PRG@ *.TXT@
#G 03 04 C:\UTILITY\STENO.PRG@ *.DOC@
#G 03 04 C:\UTILITY\STENO.PRG@ *.DIR@
#G 03 04 C:\UTILITY\STENO.PRG@ *.BTS@
#G 03 04 C:\UTILITY\STENO.PRG@ *.MAP@
#G 03 04 C:\UTILITY\ARCSHELL.PRG@ *.ARC@
#G 03 04 C:\UTILITY\ARCSHELL.PRG@ *.LZH@

- Could someone break up the MSA to the two Care Bear demos?! I can't handle

- such a big MSA. (Life's a Bitch demo and Whatta Heck Demo)

A better solution is for someone to upload a Ultra Packer version. The ULTfiles
for demos that aren't pre-compressed are usually less than HALF the size of the
MSA files. I've found, for most demos, if you MSA it, then LZH that MSA
file, it's STILL LARGER than a ULT file. Ultra Packer is a little slower,
but the extra compression is really worth it. Some 700K MSA files can be
down to 300K on Ultra Packer... (Even pre-compressed files are smaller,
say 800K MSA to 720K ULT)

> ZOO : 88312 bytes in size after compression taking 47 seconds to do so.
...

> If being able to compress files 73% smaller than ZOO is not a significant

Eh? The difference between 88 and 64 is 73%?

If you're going to compare LHARC vs ZOO 2.1, be sure to use the equivalent compression -- add 'h' for high compression to the ZOO command line, or use the -add novice command. These figures look like what you would get with ZOO 2.0 compression routines, which are slightly less efficient than the old ARC program (probably due to larger headers).

Bill's test results were not cooked. I've run several tests of ZOO 2.1 here and in every case, the compression differences between ZOO and LZH are not significant. The reliability and portability issues speak for themselves.

A friend of mine has a MEGA-ST and is looking for a new dealer for the CYBER VCR products. Until now a firm called Antic did this but they gave up.

Anybody knows where he can get these products?

I would prefer email because I don't read this newsgroup.

Thanks.

Maybe the "-" is your problem. I'm also using Mercury's RMail here, and one
group is called "sub.newusers.questions". I do not have any problems with
that group (and the name is one char longer than yours).

for those planning more "lharc is smaller than zoo 2.1" tests, note the
following (i.e. RTFM):

the default compression algorithm with zoo 2.1 is compatible with
older zoo 2.01. in order to pack with the newer (and slower) high
compression option (which should be about equal with lharc), you
MUST ASK FOR IT. e.g.

zoo ah archive.zoo file ...

note the "h". we can argue over whether it should be the default
to produce the best packing ratio or to be compatible with older
zoo versions. the latter gets my vote (the current situation).

>both took 15 secs to extract the files.

after reading what i wrote above, are we really comparing the same thing???
how did you do this? what commands did you type???

i think if you go back and use zoo 2.1 with its high compression mode, you
will find it packs about the same size as lharc 2.01e, and probably takes
10-15% longer (5 seconds maybe).

until you mention the method, we can't make any rational deductions from
your data. your research is inconclusive and not precise...

>are very good reasens for a change.

as an official developer, i got the Rainbow TOS feature list long ago. at the time, i read the document and evaluated its impact on my use. at the time i did not figure it to be that big a deal for how i then (and now) use my ST. also, i was unsure whether i needed the 2-chip or the 6-chip set (still am unsure). at the time, i needed to maintain both 1.0 and 1.2 compatibility anyway for an existing project. if i read the 1.4 specs correctly, 1.0 and 1.2 applications should run under 1.4. the reverse was not necessarily the case. using the new function calls, either consciously or by accident would have possibly made the application useless for older TOS systems (there were FAR more of these a couple of years ago). i realize that fixes in memory are desirable. i use GEMBOOT or FOLDRxxx and have had few problems in this area anyway. performance is nice, but if i want real performance, i have access to numerous supercomputers. again, for me, not an issue...

and again, the best TOS program is one which works with all TOS versions, not just the then-current level of the OS. if you don't believe me, just ask atari for the "official" position on this. apratt will (rightly so) cut you to ribbons for an infraction here :-)...

Have you edited your /usr/lib/news/active file? In that file you have
to insert the names of the groups you want to have on your system.

But you have not to writee each group, you can write comp.* (for example).

Hi netters,

I just bought an el-cheapo ST520 and I have some questions.

+ I have an original atari 360K drive. Can this drive read
Macintosh or PC disks, or do I have to invest in a better drive?

+ How can I upgrade the RAM? Do I have to buy a special board and
fiddle with the hardware to get beyond 1M?

+ What processor upgrades are there available? I have heard of the
SST board. Can I install it without pain in my ST?

Thanks in advance for your answer

Brr.. we don't you just use *.ARC,*.LZH,*.ZOO? IMHO this is better, because
with your solution, the arcshell would also be started when doubleclicking
on a file called "foo.aoo" or something like this.

>I'd sure like to have Gemini run from a ROM cart.
Yes, although the best thing would be Gemini beeing part of TOS... ;-)

As both the Atari MEGA STE and the TT has build in option for use
of HIGH DENSITY floppy disk drives in the operating system and a
possibility to turn this on by moving a DIP switch I have the
following question:

- When will Atari release a 16 MHz version of th WD-1772 FDC
that will read/write HD disks without heating up to much

- When will a HD drive that fits in the ST drive slot be available
I have tried other drives, but the front from the ST drive won't
fit (the button is fittet in another way etc etc etc...)

I know other companies can deliver FDC that manange HD drives, but
that stills leaves us with the last problem.....

>I am a unix kinda guy and have been using gulam.
>I am not completely happy (who is?) with it.
>Is mint better? what about minix?
>

gulam is just a shell, not an operating system. MiNT, on the other hand, is just an operating system, not a shell. MiNT extends GEMDOS so that some new features (multitasking, pipes, job control, and many more) are available; but there's no particular shell that *must* go with it. You can use gulam with MiNT (I do, sometimes), or you can use a shell like bash or ksh that can take advantage of MiNT features.

minix is another animal entirely; it's a new operating system that replaces TOS completely, rather than providing extensions for TOS. It comes with a clone of the standard Unix shell sh (which isn't very nice for interactive use), and with a lot of nice utilities. Note that you cannot run existing TOS programs under minix.

So which is best? It depends on what you want. You didn't really say what you disliked about gulam. It may be that another shell running under just TOS (e.g. GEMINI, which is a very nice one) may satisfy your needs. If you want multitasking, job control, and pipes, get MiNT and add bash, ksh, and/or mgr. If you want to chuck it all and start all over, you may want to try minix; give MiNT a try first, though.

--Eric

PS: you also mentioned dissatisfaction with your C compiler. Try gcc: it's free, and it's one of the best C compilers available.

>220107 after ZOO compression
>

Oh no, here we go again. These figures look a lot like Zoo 2.0 compression
for the zoo files. To get high compression mode for Zoo 2.1, don't forget
to use the 'h' flag on the command line. Then Zoo will come real close to
lharc.

The biggest advantage of zoo is: I've got it for MINIX, for UNIX of many
flavors, for DOS, and for TOS. (Maybe I'll even have a CP/M version one
day). And the zoo versions are all compatible.

Also zoo makes a fine archivin tool, allowing me to put comments for the
generated archive and/or the separate files into the archive, allowing for
generations (i.e. several versions of one file), and lots of goodies. It
can archive full pathnames and for TOS, recursively collect files. So,
what more can one want?

Now, please try that 'h' option and test again.

Over and out.

Hi!
I just downloaded a demo version of PageStream. This program looks
very nice and I am considering buying it. A few questions first though:
Is it one of the best DTP programs for the ST? The best?
Can you get different fonts for it easily? Can you make the file
into standard PostScript?
How much is it? Is there any place where I can buy it? Address? Phone?

Thanks a lot for your help!

From: longj@lonex.radc.af.mil
Message-ID: <1991Oct6.180929.12533@lonex.rl.af.mil>
Source record: 228257

I have decided that I have had it with not being able to find any software for my beloved 1040STE!!!

I DO NOT WANT TO GET RID OF MY STE!!! I DO WANT to be be able to buy some of the more popular software packages (I.e. Quicken, Tobias' MYM etc..) and use them in addition to the stuff I now know and love on my STE (like Flash, GNU-C,...) so I am looking at buying an MS-DOS Emulator.

NO, I don't want to start a "don't buy an Emulator, buy a cheap IBM" thread hear, I can't afford 600-1000 dollars to get a decent IBM with HD, plus I don't have the room for two systems.

SO---can all of you emulator users out there give me a 'lessons learned'? Specifically, relative merits, problems of the emulator you are using? I am interested mostly in speed of use for common MS-DOS programs like Work Processors, Financial and Data-Base stuff, not in running heavy graphics oriented stuff like windows etc..

What is the best MS-DOS emulator for my money, one that will work with my STE and ICD based hard-drive? I don't mind a solder-in board, so installation is not one of the criterion I am too worried about, more compatibility and speed.

Thanks in advance!!

Did you consider the fact that GIF pictures are already Lempel-Ziv compressed? This does signal a shortfall in the ZOO code, however, if the finding is correct - ZOO should be able to simply STORE a file if it can't compress it...

But I'll be sticking with ZOO for now - ZOO is already installed here at UCSD, and LHArc isn't.

> Also Apple will launch two new Macs with using the 68040 processor.
> (How do you like that, Dave Small?) These will run by the name 'Quanta'.
> There will be a desktop and a floor version.

> Eventually there's a replacement for the SE/30, the Super Classic.

Get your facts straight.
There are indeed three new notebook macs comeing out, but none of them
is a pen based machine. They are all variations on the same basic
notbook design.
The new 68040 machines are the Quadra 600? and the 900, and they are
really for massive servers mopre than desktop maschines and are in tower
cases.
The new classic is called the classic/030, or 030/classic.

nice machines, but overpriced, sorta like atari.

PageStream (PgS) is now at version 1.2, and is one of the best dtp packages
out. i t now supports EPS clip art as well.

I own both it and Calamus 1.09N (which hasn't been updated this year) and well
some prefer Calamus I think that PgS is easier to learn and to use.

There is a magazine (diskzine or somesuch) called RADICAL TYPE to support
the Atari ST and the Amiga version of PgS.

Softlogic publishes PGS and is an American Company in St. Louis MI.

It uses Adobe Type I fonts now as well as PgS propreitary fonts.

what else? well it works well with my Panasonic KXP4450 laser printer.

I highly recommend PgS and Softlogic.

The demos are in 50Hz. My monitor rolled as well when I first bought it.
Basically, you have to adust it so it's stable for both 50Hz and 60Hz.

I don't need to be convinced that TurboST is faster - that's obvious. I'm not
convinced that TurboST implements all calls _exactly_ as Atari intends them
to be. (I heard that Gemini, for one, does not work correctly with TurboST).

From: kiki@uhunix.uhcc.Hawaii.Edu
Message-ID: <15118@uhccux.uhcc.Hawaii.Edu>
Source record: 228269

Sybex Germany is publishing a 1300 page book about the new STe and TT machines which will probably contain all the information we need! The author is Julian Reschke, who also happens to be on the net.

Has anyone in Germany seen the book in the shops? I'd like to order a copy.

I think that Atari and Sybex could get together and distribute their documentation on CD-I disks. The audio portion could be in German, French, English, etc., at the user's preference and the example code could be cut and pasted for immediate use. I think the savings on paper and shipping would make it something most people could afford.

Jack

3285. Microware OS/9 Catalog

Newsgroup: comp.sys.atari.st

The Microware OS/9 Catalog is actually more like a 200 page encyclopedia
because it explains and illustrates every aspect of the operating system--
even the system calls and call function codes are listed and described.

Some of the features (as printed on pg. 5) of OS-9/68000 are:

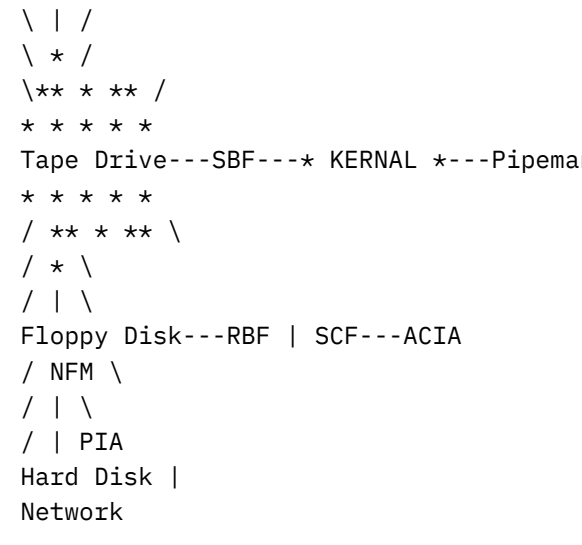
o Multi-user, multi-tasking executive
o Essential functions with real-time response
o Versatile re-entrant, position-independent memory module design
o Support for arithmetic and I/O coprocessors
o Extensive management of all systems resources
o Hardware independent, UNIX I/O model
o UNIX task model - fork, set priority, etc.
o Pre-emptive task switching with time share option
o 100% ROM-able
o Independent file managers to support every class of I/O device
o Rugged "crash-proof" file system
o UNIX software compatibility at C source code level
o Complete suite of development tools:

Tools Languages
----- ---------
C source level debugger C
Symbolic debugger BASIC
System state debugger Pascal
uMACS text editor FORTRAN
Electronic Mail Assembler
UniBridge and PC Bridge
SmartWare

Kernal Options I/O Options
-------------- -----------
MMU (Security Protection) Disk Support
Math Coprocessor support Magnetic Tape
Internet - TCP/IP
Network File System
OS-9/NET - Arcnet
RAVE - Real-time audio video

OS/9 has a modular design so that the end user can configure it to his/her
particular application. MIcroware depicts the modularity with this type
of depiction: [My depiction looks more like a pollen grain sorry!]

Applications
|
Math Lib | Shell/Utility



"The nucleus of OS-9 is a real-time ROMable Kernel which serves as the system administrator, supervisor and resource manager. The real-time Kernel is written in 680x0 assembly language to maximize speed and minimize system overhead. It can be configured independently for stand-alone operation or with the shell and file managers as a complete operation system."

"The real-time Kernel's primary function allows multiple processes or tasks to execute independently, in a controlled environment, and provides communication between these tasks. This gives the system integrator the ability to set priorities on a process to run synchronously with the system while being able to respond to asynchronous external events as they occur in the real world."

The acronyms SBF, SCF, RBF, and NFM represent the I/O File Managers:

Sequential Block File - used with devices such as tape drives.

Serial Character File - used with devices such as terminals, modems and printers.

Random Block File - used with floppy and hard drives.

Network File Manager - an optional extension used to network with other systems.

Pipe File (Pipeman) - supports interprocess communication thru memory buffers ("pipes").

"OS/9 provides a UNIX-like 'shell' command interpreter program that allows users a high-level interface to the internal functions of the operating system. The OS/9 Shell Utility Set contains over 72 commands. These commands set the 'user' environment, allocate memory, redirect I/O, monitor processes, match wild card patterns, manipulate files, manage time, edit text and provide a host of other functions."

Some of the shell commands: attr, backup, binex, compress, copy, dir, echo, edt, format, free, grep, help, irqs, kill, link, login, logout, make, procs,

qsort, set, shell, sleep, tee, touch, and wait.

The OS/9 Catalog is packed with a lot more information, so I would recommend that everyone get a (free!) copy by calling 800 475-9000.

Also be sure to ask for a copy of Microware's 'Pipelines' magazine. The current issue covers OS/9 in France (systems controlling Port of Havre, France locks, Monetel pay phones, and image processing at Thomson-CSF Laboratories). It also lists a whole bunch of VME boards ranging from a 68040/030 SBC, SCSI and Ethernet adaptors, and image processing and high-performance graphics modules.

For people outside of the U.S., other Microware offices to contact:

Microware Headquarters (Des Moines, IA) - (515) 224-1929, Fax: 224-1352

Microware France - (33) 42.58.63.00

Microware Japan - (81) 3-3257-9000

Microware U.K. - (44) 703 601990

3286. Atari confirms TT CD-I project; gets RAVES

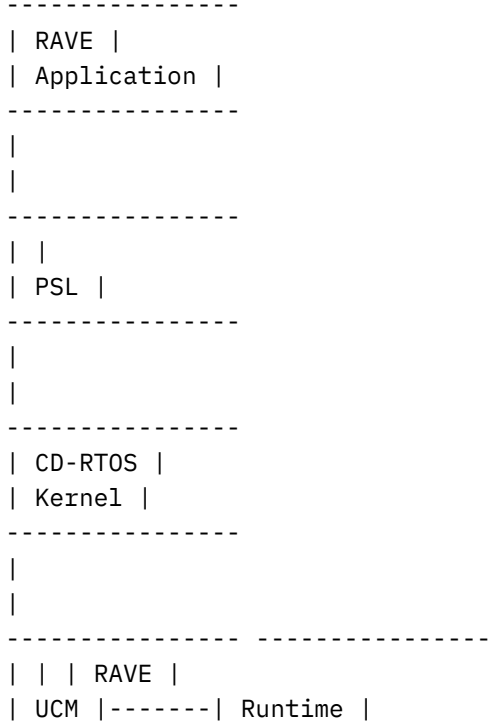
Newsgroup: comp.sys.atari.st
Date: 1991-10-07 09:57:00 UTC
From: kiki@uhunix.uhcc.Hawaii.Edu
Message-ID: <15120@uhccux.uhcc.Hawaii.Edu>
Source record: 228271

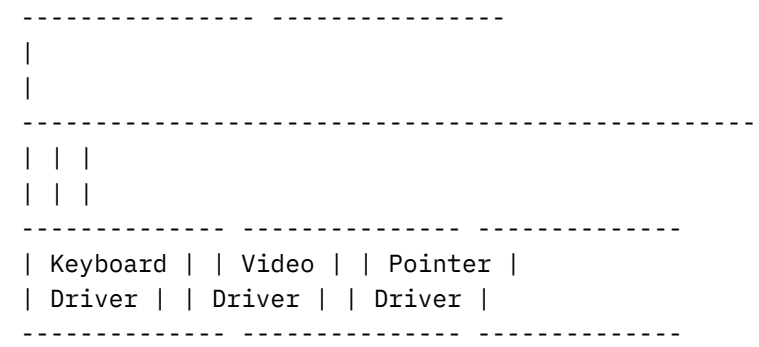
Atari's Director of Developer Services, Bill Rehbock, confirmed at the
The Glendale Show that the TT would become a development platform for
CD-I (Compact Disk Interactive) players. The CD-I players are based
on 68000 family processors and are controlled by CD-RTOS (CD Real-Time
Operating System), which is a specialized version of OS-9/68K developed
by Microware.

The following information is a product overview of some of the software
"building blocks" that Microware has available in order for someone to
create a CD-I application.

RAVE (Real-Time Audio Video Environment) is an object-oriented multimedia
environment for CD-I players. Unlike traditional graphics interfaces, RAVE
is based on the use of natural images and high-quality digital audio sound.
RAVE is designed to emulated real-life actions and sound in a contained en-
vironment intuitive to the beginning user.

CD-RTOS/RAVE consists of a C Presentation Support Library (PSL) and a
compact runtime module. The runtime module extends the functionality
of the User Communication Manager (UCM). The PSL give the application
access to many common data structures and managers for those data struct-
ures.





The RAVE Runtime Module handles message management between the system and RAVE applications as well as between various RAVE applications. Each process is allocated a single mailbox, although a process may have several mailboxes. These mailboxes may be dedicated to a certain type of message or for communication with a specific process.

The RAVE Runtime Module also provides the following functions:

o Multi-tasking executions of graphics applications which allow multiple applications to run concurrently

o Full-featured message sending and receiving for inter-process communication

o Automatic tracking and journaling of user actions

o Complete graphics cursor management based on locations within the display

o Support for premastered advanced local special effects

The Presentation Support library is a collection of high-level functions for simplifying application development for CD-I systems. It includes eight primary managers and some miscellaneous support functions, which are comprised of:

o Controls to allow an application to obtain input from the user using visual objects

o Requests to allow an application to ask the user multiple choice questions and obtain a reply

o Visual effects to generate mattes, wipes, fades, dissolves and cuts

o Resource modules to separate country-dependent data for program efficiency

o Memory management support

The Special Effects Manager includes over 25 advanced special video effects. Sample source code is also included to help you customize effects and allow applications to consistently create their own effects.

To obtain more information about CD-RTOS/RAVE, the CD-I C Library, CD-I ProPak and CD-I Studio Services (with authoring, video pre-production, audio encoding, tape mastering and consulting) contact:

Microware Systems Corporation
1900 N.W. 114th St.
Des Moines, Iowa 50325-7077
Phone: (515) 224-1929
Fax : (515) 224-1352

Microware Regional Offices:
Western - (408) 980-0201
Southeastern - (407) 725-2840
Northeastern - (603) 929-4107

Microware France - (33) 42 58 63 00
Microware U.K. - (44) 703 601990
Microware Japan - (81) 3-3257-9000

It seems to me that Atari made a good choice by tieing their TT with CD-I because it will allow OS/9 to become a popular alternative OS. The real-time features that allows it to control devices in the industrial environment makes it a natural for the homes of the future which will be networked with the world and which contain smart appliances and fixtures linked with a common bus.

The first CD-I player is expected to be introduced October 16 in the major cities of the U.S.; it will have a list price of $1000 (discounted to $700-$800?). It will be interesting to read a post from anyone who gets a chance to try it out!

Anyone with more information about the following?:

Atari multi-tasking TOS release on March '92 (is it in a form of ROM upgrade?)

Atari Ajax processor (any details available?)

Atari Falcon (68040-based system? What about Panther, Jaguar? Zoo?)

Chips & Technology $35 PC 386 system-on-a-card heralding the age of calculator-priced DOS machines. Also introduced six other processors. (Will Atari integrate them into ST models?)

Federated owners were sued by Tramiels (How is that case going?)

Fisher Germany develops a read/write CD system with 450 ms access and $800 price tag.

OmniTek introduces Omnichrome graphics board with 256 colors/16 million palette for the ST. Utilizes video DRAMS which may be added to upgrade the $299 base configuration (640x200) up to 800x600 resolution. (What graphics processor does it use? Is RAMDAC upgradeable? It supposedly installs in Shifter socket--how does it work?)

PC Magazine rumored about PgC 7600 $20 200 MIPS processor manufactured by Plessey; utilizes multiprocessing OS called Taos and also with 80x86 emulation, running PC software. Apple Computer is doing study of it. [If anyone in Cambridge, England has PgC Ltd.'s address handy, please email it to me]

STabloid is a shareware disk-based magazine featuring demos along with source code that is distributed by BBSs. (Is it available at any net archive?)

TMM compression system allows 240 minutes of full-screen full-motion video on a CD-ROM (This doesn't seem possible!?)

Toshiba will buy stake in Warner Communications. (Doesn't Warner have some kind of stake in Atari too? Now Atari can buy factory?)

```
Be sure not to delete any trailing spaces after each line, and be careful
not to exceed 1024 bytes (each lines gets a CRLF appended in ST memory on
read). That 1024 limit is not for TOS 1.4 but for earlier versions. TOS
1.4 and above upped it to 4098. But some programs will barf if the shell-
put/get buffer is too large.
```

Cross-posted to: comp.sys.atari.st,sub.sys.st,dnet.atari

Hello Atari-fans,

I heared from UltraScript, a PostScript package for the Atari ST. It should
be able to view PostScript files and to print them on a variety of printers
(I need the driver for the NE P6). Could someone send me
1) more informations about UltraScript,
2 the address of a distributor here in Germany,
3) or the address of the company ?

Thanks in advance

On the subject of Atari computers on Telly..

A few weeks ago I saw an episode of the American TV program "Dream On". In it the main character was writing a play (or was it a novel) on what looked like a Mac Plus with an IBM PC/AT extended keyboard with the screen showing what looked like 1st Word Plus with an Atari logo in the top left, in the menu bar.

Did anyone else see this, or was I halucinating (is that how it's spelt?)?

To everyone out there looking into LaserJet III (&IIIp), they are great! They produce output better than most 600dpi printers. They will work with virtually any of the older LaserJet drivers. You will, however, NEED more memory to use either Calamus or PageStream. I have 3megs in mine, and I have never had a problem with memory. When I bought it it had only 1meg, and neither Calamus nor PageStream would print a full page at highest quality. I bought a second party memory card with 2megs for $180, it works fine, and 1meg from HP is $300. So I recomend second party add-ons.

>How much is it? Is there any place where I can buy it? Address? Phone?
>
> Thanks a lot for your help!

Generally Calamus is considered the best, and PageStream (2.1) is considered second best. However, if you need to do color PageStream is the only current option (I have the Calamus SL demo, but as of yet no upgrade notice). Generally Calamus has a better interface, but takes longer to learn how to use. Calamus is also considerably faster at ALL functions, and this goes for SL and Pagestream 2.1 also. Calamus is especially fast to the printer, and still gives slightly better output than Pagestream 2.1 (calamus can be set to produce much finer fills and smoother gradients than PageStream, even if going through postscript). PageStream is still a very good program though, and I would recomend getting your hands on a machine with Calamus and Pagestream 2.1 and trying them with access to the instruction manuals. Calamus without a manual would probably be impossible.

>>
>The demos are in 50Hz. My monitor rolled as well when I first bought it.
>Basically, you have to adust it so it's stable for both 50Hz and 60Hz.

There is more to it, most demos nowadays use a thing called 'sync scrolling',
it involves lots of sync-switching (50-60-70Hz) in the top border of the screen.
The poor Shifter will get confused by this and will forget to draw parts of the
screen, resulting in a change in screen address that can be up to 8 bytes,
effectively scrolling the entire bitmap. It works a bit like the smooth
scrolling on the 64. Also, you can trick the Shifter into not drawing the
borders, that's all the full-screen stuff you see.
There is one drawback to this, different machines are subtly different
(I'm talking clockcycles here) and also, your monitor has to be able to
handle 50-60Hz sync. (This means it doesn't work on most TV's) This is also
the reason why commercial products hardly use this technique. There are a
few games I know that do it, and some of them look pretty good using it,
doing smooth all direction scrolling.
Also, it's very hard to do it right, it takes a whole lot of fiddling and
clockcycle-tampering, so it is for freaks only (aren't we all) :-)

>coders at Atari can do better with a 32MHz machine.

Try to compare the speed of a general bit_blit, with blitter active to a
bit_blit 'under' software blitters (NVDI, TurboST,QuickST).
The reason you don't notice much speed increase with blitter on the desktop
is that all access is aligned to bytes, and the blitter is best at bit-aligned
access. Try to move a block of graphics in a (clean) paint program (to ensure
that the blitter is used), or a non-clean paint program that knows about the
blitter.

The Atari blitter is also good at filling horz. lines (4 planes with dither
in four memory accesses per. 16 pixels). And in only ONE BLIT!!!

By carefully choise of the halftone ram, you can also get it to scale your
bitmapped graphics (in the width!).

-Klaus

3298. Problems with Supra HD I/F

Newsgroup: comp.sys.atari.st
Date: 1991-10-07 17:48:00 UTC
From: dxper@dtek.chalmers.se
Message-ID: <5251@chalmers.se>
Source record: 228279

I'm experiencing boot:ing problems with the following setup:

An old 1040ST running TOS 1.40
A supra interface (1989 or even older issue)
A Micropolis 1375 (150 Mb, SCSI) drive
A Konica 5 1/4 10 Mb removable media drive (SCSI)

The Micropolis and the Konica drive is connected to the same lead.
The Micropolis is unit (0,0) and contains the boot partition (C:).
The Konica drive is unit (1,0).
Both drives have their own power supply with the konica unit feeding the
supra interface. The lead connecting the drives is ~1.x meters long.

The problem I'm experiencing is that when I power up the system won't boot
and I always have to do a reset manually (after the cold start has finished)
and the it works ok. (the 1375 drive does spin up, though, at power up)

After the initial booting reseting (both cold and warm) the machine works
error-free until I turn the power off.

I'm using the removable media driver as boot driver on drive C; if I switch
to the standard driver the removable drive won't work 100%...

Ofcourse these problems aren't giving me too much trouble but it *is*
annoying always having to do manual resets ...

Is there anyone out there who have had similar experiences or does anyone
know how to reach Supra Corp from the Internet...?

pao

I can't say about this show, but I saw "Servants Of Twilight" and the
P.I.'s secretary had a 1040ST on her desk. Not much later I saw the
movie "Steel And Lace"--while the screen displays were NOT ST screens,
the keyboard sure was..Looked like an older 520ST..

Also saw several episodes of "Friday The Thirteenth" (a great show) that
featured Atari STs very prominently.

3300. TT Unix etc.

Atari Germany has now started selling their Unix for the TT, Atari System V Rel. 4 (ASV). Software is retailed at 3649,74DM for a 213 MB HD or 4486,76DM for a 340MB HD (Maxtor drives).

The ASV developer's edition comes along with:

X Window 11.4
OSF/Motif 1.1
WIsh (graphical shell)
GNU C/C++ compilers and GNU debugger (all Rel. 1.39)
AT&T System V debugger
X Facemaker 2 (Tool for creating graphical user-interfaces)
Networking File System
Remote File Sharing
TCP/IP
BSD Sockets

Atari is also going to build a new "European Support Centre" at Raunheim in Germany where Ralf Rodriguez (Atari's ASV development director will run support for european ASV developers.

3303. Mega2 questions

Newsgroup: comp.sys.atari.st
Date: 1991-10-07 20:40:46 UTC
From: kenneth@matt.ksu.ksu.edu
Message-ID: <kf1hieINNbeq@matt.ksu.ksu.edu>
Source record: 228286

Questions:

1) Does the Mega2 take standard simms?

2) How much memory can one stuff into a Mega2 before aditional
hardware (cards..etc) is required?

3) What seems to be the going rate for the needed memory for
the Mega2 these days?

Thanks....

3304. Sequencer/Sync Box for sale

Newsgroup: comp.sys.atari.st

For Sale: Passport Designs' Master Tracks Pro for Atari ST.
Features Simpte generation.
Latest version (final?) V-3.6
Complete documentation.
Asking $140.00

J.L. Cooper PPS-1 midi sync box.
Using this with Master Tracks pro allows
you to 'stripe' your analog tape with
time code, locking your midi devices in
time with your analog recording.
Comes with owners manual and power supply.
Asking $80.00.

Both items are in perfect condition.
Call: (508) 831-5237 (weekdays)
(508) 835-6772 (eves, weekends)
or reply via net, ask for Doug.
Thanks..

>have a 4 meg 1040ste...

The first .msa file is tracks 0-40, the second contains tracs 41-82. You
restore both .msa file to the same disk. This might be your problem.

If it works, please post a description of the demo. Us non-ste'ers are
wondering . . .

>
>I DO NOT WANT TO GET RID OF MY STE!!! I DO WANT to be be able to buy some of
>the more popular software packages (I.e. Quicken, Tobias' MYM etc..) and
>use them in addition to the stuff I now know and love on my STE (like
>Flash, GNU-C,...) so I am looking at buying an MS-DOS Emulator.
>
I use PC-Ditto I (the software emulator) to run Quicken 4.0. Quicken, like the name implies, is fairly fast so that software emulation is tolerable. I recently added AdSpeed (16 MHz). This results in Quicken responding as if you had a hardware XT. And it speeds up all my ST programs significantly. (BTW, use DOS 3.3 for best performance.)

For the other software, I much prefer the Atari environment. To give myself a high degree of compatibility at work, I use the following on my 386:
GEM 1st Wordplus - data interchangeable with 1st Word on ST
GEM Drawplus - data interchangeable with Easy Draw on ST
Lotus 123 / Quattro Pro - "" "" "" LDW Power.

Although I do not use a database at work, I use Superbase Personal at home which has configurable record delimiters (so could interchange with other DB programs). It is my understanding the Superbase is available for PCs running under GEM. I also use DR DOS 5.0 at work. The ViewMax shell gives me a little of the Atari feel and relocates a bunch of junk to high memory yielding more of that precious 640K. (It still is about 2 or 3 hundred years behind NeoDesk 3, but it beats MS_DOS command lines! :-)

Sorry to stray from your question re: emulators. But be carefull, you might get what you wish for (i.e., having to run more PC software! :-)

Regards,
R.C.G.

>There is one drawback to this, different machines are subtly different
>(I'm talking clockcycles here) and also, your monitor has to be able to
>handle 50-60Hz sync.

More to the point, not all shifter chips can handle this, and on machines
with the earlier shifters this technique produces a jittery mess. As
you said too, some monitors can't be synced to both 50 & 60 hz.

A word to the wise: Don't abuse the shifter this way unless you want
your software to break on lots of machines. Relying on undocumented
hardware anomalies like this is not impressive -- it's poor progamming.

3308. Accelerators for the ST forsale

Newsgroup: comp.sys.atari.st
Date: 1991-10-07 23:01:11 UTC
From: stevef@bug.UUCP
Message-ID: <832@bug.UUCP>
Source record: 228306
Cross-posted to: misc.forsale.computers,comp.sys.atari.st,or.forsale

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included (add $5 for shipping outside the U.S.). I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request (they are available separately along with a blank board for $15). Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

If you want one of these, call or send a check to:

Does anyone know if the SST will fit into a 1040stf? A friend of mine has
a 25 MHz 68030 just looking for a good home. It wouldn't be 40 MHz, but
I imagine a little bit faster than my 8 MHz 68000.

SST can be fitted to ANY ST with the conventional DIL-type 68000.
With 520/1040's you propably have to install the motherboard to a PC
or a tower-case to get enough room for the card. STE:s have PLCC-type
68000, they are out of the question.
So, any ST, STM, STFM, MegaST will do.

>
>Karl Anders Oygard - Karl A Oygard <data3d@aahs.no>

working soon for those who want it. As for A/UX, since Dave is a UNIX wiz, if
it does not work at this time, I'm sure he is working on it, or can at least
let you know one way or the other.
- David Butler -

Apple's A/UX requires a 68030 based machine, minimum of 8Mb RAM and
160Mb hard-disk space. Also a CD-ROM is highly recommended (othervise
the system has to be installed by Apple, it is delivered on CD).
So getting A/UX to run with Spectre definitely requires a TT or SST.
And it may still be very tricky... Or I would rather say nasty?

I second this. The TCB Soundtracker was on the monthly disk supplied with Atari ST User issue july 91. It is the full commercial version with docs included. The magazine costs 2.99 pounds (you could probably order it from Sideline Software in Florida). I do not see anything in the docs or in the magazine about distributing the software. I would assume that it would be illegal, but I cannot find this printed anywhere. Anyone know if I can put this on atari.archive?

Please post any .MOD sources to c.s.a.st. Thanks in advance.

^^^^ ^^^^^^^^^ ^^^^^^^^

Why are there different prices for each configuration? The price is for
the software only, I expect. And as far as my experience with Interactive
UNIX on a 386 goes, the software is the same for whatever harddisk there is.
You could always add a disk (provided the machine can handle them).
Is this some weird UNIX implementation of Atari or what? The package does
look nice and complete, though.

I believe that Atari ST User said quite explicitly that this was NOT a public
domain version, so I don't think you can upload it to a.a. There IS however,
a demo version (lacks a lot of the featuers) -- I imagine you could upload this.

Concern: Atari on TV

Hi there,

last evening in tv they had a documentation about the 2 germans who got
the medicine Nobel prize yesterday - Dr. Nehre and Dr. Sakman. For several
minutes you could see that at least Dr. Nehre did his research with Atari
computers !!!

One could admire: several Mega STs
some Megafiles
a Vortex (or Protar) M44 removable
selmade (measuring?) software on SM124 screens

What about this role of Atari in TV ???

3325. Re: Problems with Supra HD I/F

Newsgroup: comp.sys.atari.st
Date: 1991-10-08 10:02:50 UTC
From: r0mill01@ULKYVX.BITNET
Message-ID: <1991Oct8.100250.16867@vlsi.louisville.edu>
Source record: 228307

I've had the same problem and returned my 1985 drive right after purchase
twice to Supra. They decided the problem was with my ST controller.
I now have two Supras (why didn't I learn?). The new one is a 1990 vintage.
I powers up without a problem, but the older model still fails even though
it's daisey chained to the DMA port through the new drive. I believe the
problem has to do with Electrical Interference between the ribbon cable
and the SCSI controller board.

BTW some of Supra's controllers will exhibit startup problems with
multiple SCSI devices if the devices are not all ODD numbered or
EVEN numbered (i.e. (1,0) and (3,0) or (0,0) and (2,0) are ok but
(0,0) and (1,0) are not).

Hope this helps,

Robert Royar

Did you not accidently remove the cntr-Z at the end of the file
or inserted an extra space somewhere?
You should be very carefull when editing the desktop.inf file
the format is real strict. But it should work I did it many times
without problems

The Doodle format is nothing else than a screen dump of a monochrome
ST resolution screen (640X400).
You can use any program that lets you import a file of extactly 32000 byte.
If the program looks for a certain extension just chance it (the file that
is)

> I am chasing a program that does such format!

I know of columbia a PD program look for it in the Atari archive.

3331. gnu again !!

Newsgroup: comp.sys.atari.st
Date: 1991-10-08 12:44:21 UTC
From: arshad@siesoft.co.uk
Message-ID: <1991Oct8.124421.9341@siesoft.co.uk>
Source record: 228309

Few weeks ago I posted an article regarding possiblity of running gnu cc and
c++ on a Mega ST4 with only a single floppy. All the people who responded to
that article advised me to save time (and hairs) and get a Hard Disk. So
I bought a Protar 80M harddisk. After getting the harddisk I tried to
get the software from atari.archive.umich.edu using email (I dont have ftp)
but no luck. I sent request as follows :
To: atari@atari.archive.umich.edu
Subject: junk
send gnustuff/tos/gcc/bin/gccbin00.zoo

Is there something wrong with the above request ?

Is somebody willing to mail me the software? Please email(arshad@siesoft.co.uk)
me before sending any software - I dont want to receive more than one megabyte
of software in any one day.

I need the following files (or later versions) :
gnustuff/tos/gcc/bin/gccbin00.zoo
gnustuff/tos/include/bin/incbin71.zoo (or incbin72.zoo)
gnustuff/tos/lib/bin/libolb71.zoo
gnustuff/tos/documentation/gccdoc.zoo

gnustuff/tos/gdb/bin/gdbbin11.zoo
gnustuff/tos/documentation/gdbdoc.zoo

gnustuff/tos/g++/gxxbin.zoo
gnustuff/tos/g++/gxxinc.zoo
gnustuff/tos/g++/gxxlib.zoo

Thanks in advance.
arshad.

3333. What's been goin' on since 1988?

Newsgroup: comp.sys.atari.st
Date: 1991-10-08 14:30:48 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1991Oct8.143048.2790@exu.ericsson.se>
Source record: 228310

I used to be fairly active in the Atari 8-bit world from 1982-1988. I followed all the hooplah surrounding the introduction of the STs and almost purchased one, but I ended up getting a low-end PC clone instead (I needed to run Turbo Pascal at a decent clip). I realize that the ST is *not* a high-end version of the old 800/XL/XE, but it *is* a decent system and the price is very right.

Anyhow, I'll be getting another computer soon and it doesn't need to be compatible with any other machine. So, could somebody fill me in on what's been happening since 1988? From my very minor exposure to the Atari world since then, it seems that U.S. ST support has all but disappeared, the Mega-STs were introduced, then the 1040 STE, Mega-STE, the long-rumored TT, and the Blitter chip (which, so I've heard, isn't all as great as it was supposed to be). What else has happened? What's the difference between the ST and STE? Have most of the major ST software producers gone under? Who are the "big names" these days? Any major new software releases? How is Atari's support? How is the public domain market?

Finally, if I were to purchase an ST, which model would you reccommend? (I personally can't stand the all-in-one design of the 1040, but I don't know anything about the other machines).

Any answers/help would be appreciated?

>- David Butler -
> "What ever happened to free love anyway?"
>
> -innagaddadaviddababy-

If anyone needs the documentation for Calamus, I've got the whole thing as
textfiles. They come from the Sewer Doc Discs, compiled by the Australian
hacker crew Sewer Software. It may add up to a few hundred of kbytes, and I
can't put them on the net (the Sun's can't communicate to my STe yet), but
I would send a copy by snail to anyone who need the doc's to see what Calamus
really can do.
I suppose I should add that this is intended for use with the Calamus demo.
(As there is no need for those doc's if you have the real stuff), I'm not
very eager to help any pirates out there!

If you want this, email me at d91jn@efd.lth.se
or send a blank disk and 2*int.rep. by snail-mail at

Jerker Nilsson
Kamnarsvagen 4:2108
S-226 45 LUND
Sweden

(you'll have to send the disk, as I am almost out of them)
Don't forget to mention if you can't use double sided. (coz i may have to
crunch the files to fit them on a singel sided floppy).

Hope to help U

>Is this some weird UNIX implementation of Atari or what? The package does
>look nice and complete, though.

The prices mentioned include the harddisk. So you pay approx. 800,-DM
extra for 130Mb extra diskspace.

More interestingly, can somebody tell me what the official prices for a
complete TTX (8Mb + SM195 + 210MbHarddisk with Unix installed) are ?
At the Atari Messe in Dusseldorf a Atari-rep. mentioned a price
of 8.000,-DM incl. taxes. Is this the real thing ?
(in the Netherlands a Atari-rep. mentioned a price of 12.000,-Dfl excl.
taxes, which comes down to about 12.700,-DM incl. taxes, ridiculous isn't it).
And most importantly who can buy any of the above, only official
developers (how easy is it to become one in Germany ?) or anybody
who is willing to pay the money.

I think, you are wrong. I work with a DESKTOP.INF like that since a long time and had no problems. There are some minor things, that you should pay attention to. All lines in the DESKTOP.INF-file must have an extra trailing space before <CRLF>. There are some editors like 7UP (Ed, I just talked to the author, he will make an english version soon), that cut off trailing spaces when saving the file. also an extra <CTRL-Z> (Hex 1A) has to be attached as the last byte of the file.
I hope that helps.

Bye.....Michael

>Is there something wrong with the above request ?

Yes, there is. The problem is the file is no longer there. Graham Higgins has been rearranging the gnustuff directory, and as of late, we received several megs of new gnustuff from Jwahar Bammi that is being assimilated to the current collection.

This particaular directoy changes almost daily, and therefore I *highly* reccomend that you check the index before you try to request anything. It'll save you the frustration of not receiving anything, and it'll save me the time of replying to problems like this.

You needn't request the whole Index, or even CompInd.Z. Instead try this :

send gnustuff/Index

This will send the index for *only* the gnustuff directory.

Can smoeone give me some help with ST Basic? I'm trying to build a interface device with the joystick port, and there doesn't seem to be a STICK or STRIG function. It's rather frustrating because every Basic manual I've consulted tells me otherwise (for different Basic's) .. Any help would be much appreciated.

Pat.

I'm thinking about getting a hard drive and want to know if these drives are as good as they were presented by the sales person over the phone.

Supposedly, they are faster, quieter, and cheaper than Seagate drives. Is this true? What kind of problems might I have with the Quantum that I might not have with a Seagate?

Anybody recommend them? BTW, the company is Toad Computers. All I've about them is good stuff so I'm thinking that they wouldn't mislead me, but I want a 'second opinion', so to speak.

Thanks in advance,
Kenneth Love

Source record: 228329

Several years ago, a friend of mine told me of some software he wrote on his 1040st to sample an analog signal (sound). I thought he did this with minimal hardware.

Does anyone know of an easy way to do some analog to digital conversion on the ST? I am trying to simulate an encryption scheme for a design project I am working on.

Please respond with email. Thanks

Dave

>68000, they are out of the question.

If the ST(E) motherboard is to be rehoused anyway there is no reason not to
use a PLCC-to-DIP adaptor socket between the STE board and the SST board
(if the adaptor can be obtained for the right price).

At 8 MHz bus-speed even homebrew techniques are available for this purpose.
On the other hand, word has it that a special STE version is in the pipeline
also. People who like the original STE case will probably prefer to wait for
that version in order to avoid painful surgery.

Expect wrong. They include the Hard disk normally. Or did you think it came
in a box of 300 floppy disks? :)

I'd say the 213MB HD is full to the brink, while the 340MB has, well, 130MB
to spare.

> Any answers/help would be appreciated?

Hi, James.

I think it would help a lot if you told us (A) your price range, and (B) what your interests are. If you want MIDI or desktop publishing, you've picked the right place (I've also seen great Mac DTP, but not at a great price). If you want games, you might go with the low-priced Amiga (aka the Fisher-Price Plug-and-Play computer).

Can't really generalize further.

[TEXT DELETED]

Atari is selling the drives, completely set up and ready to run.

This is perfect for the VAR (Value Added Re-sellers) because they don't have
to spend the hours needed to install the operating system from floopy
or tape.

As a system administrator, I can appreciate not wasting that time. It also
ensures that the drives are compatable and fast enough :-)

> 1) Does the Mega2 take standard simms?

No.. the MegaST series uses 1Meg x 1bit DIP RAM chips.

> 2) How much memory can one stuff into a Mega2 before aditional
> hardware (cards..etc) is required?

ANY Atari ST is limited to 4 Megs of RAM.. period. Doesn't matter what combination of hardware, cards or chips you want to use, 4 Megs is IT.

> 3) What seems to be the going rate for the needed memory for
> the Mega2 these days?

RAM is relatively cheap.. about $50 per Meg, depending on where you buy it.

Important Cavet... originally the Mega ST2 and Mega ST4 used exactly the same printed circuit board. The only difference was that the Mega ST2 had only half the RAM chips installed. Atari later redesigned the Mega ST2 motherboard to cripple it, and prevent anyone from easily (and cheaply) upgrading to 4 Megs. If you have one of the later boards, upgrading becomes a great deal more complicated, as well as unreliable. Check your motherboard before deciding what to do about expanding your RAM.

It's a free "ad" only if it says "ATARI MAKES REAL COMPUTERS AND THESE ARE
SOME OF THE COMPUTERS THAT ATARI MAKES"

To "Mr. Joe Average on the Street", all they are is "computers" or "PCs"...
if he thinks anything when he sees anonymous computers like the STs in those
labs, he thinks about the Computers he's seen advertised... and that doesn't
include Ataris.

YOU know, and I know, that they were Atari Computers... unfortunately,
99.9% of the rest of the world doesn't even know Atari exists.

>>I have been looking for FTP sites that have .MOD tracker music files,
>>can someone pass along a few internet addresses which have some?
>>

Try ab20.larc.nasa.gov for MODs. This is the main Amiga FTP site and since MODs were designed for the Amiga this is where most of them are. There are over 150 MODs on ab20 unless some have been deleted lately to save space. The MODs are in the /incoming/amiga and /amiga directories. Look for subdirectories with SoundTracker/NoiseTracker names. SoundTracker and NoiseTracker are the Amiga programs that create MODs. Since you will be using a MOD Player designed for the ST/STE there will probably be some MODs that cannot be played correctly. There certainly isnt an Amiga MOD player program that will play all MODs correctly. The MOD format was created by European Amiga hackers to create music for their demos and thus there is no formal specification of the MOD format so MOD creators often added weird little changes to the format that mess up some players. One more thing should be noted by ST/STE owners; The Amiga isnt limited to 8 character filenames + 3 character extensions so when you get the MODs from ab20 and unLZH them you will often get very long filenames , some of them right up to the Amiga's 31 character filename limit.

I have recently bought a Quantum LPS105S (105 meg, 20msec, 1130kb/sec)
and daisychained it to my existing ICD host adapter and Seagate ST177N.

The drive is really nice, but so far I've been unable to get it working
properly. I managed to format it but after it had warmed up, I would get
continuous write errors until I couldn't write to it any more. I've talked
to ICD and they initially said that the drive was faulty, but I've had it
tested by the dealer I bought it off, and they say there are no problems
with it.

Last week I tested it with a Sun SLC and it worked fine, but now I can't
even recognise it with my ST.

I bought it because I'd seen lots of recommendations for it, but other
people seem to be using Quantum drives with no problems.

Does anyone have any ideas? I've just about run out and it's very annoying
have 100 megs of unusable disk space on my desk :-(

Why don't you believe it? The prices *DO* include the harddisk. Obviously there is no sane other reason. The Atari Unix is definitively priced OK!

```
FOR SALE: Passport Designs' Master Tracks Pro for Atari ST.
Features Simpte Generation
Latest (final?) version 3.6
Complete documentation, original (registered) owner.
Asking $130.00
(p.s. Passport allows upgrades to IBM or Mac version.)

J.L. Cooper PPS-1 Midi Sinc box
Using This with Master Tracks Pro allows
you to 'stripe' your analog tape with time
code, locking your midi devices in time
with your analog recording.
Comes with owners manual and power supply.
$80.00

Call: (508) 831-5237 (weekdays)
(508) 835-6772 (eves, weekends)

Ask for Doug.
-Thanks-

Chris-

The Data Diet demo will allow you to "normalize" all your dietized files. Of course, like any demo, it is strongly recommended to have a backup of your files... ;)

3369. Simple, quick-to-setup BBS needed

Newsgroup: comp.sys.atari.st
Date: 1991-10-09 15:38:40 UTC
From: apr1@ra.MsState.Edu
Message-ID: <1809@ra.MsState.Edu>
Source record: 228346

Due to unfortunate circumstances, I have to leave my stupid Seagate
Hard Drive on ALL DAY LONG! I figure that as long as the computer
and hard disk need to stay on, I might as well do something
useful with it-- make the ST into an answering machine.

What I need is a reference to a quick-n-dirty message base.
I really don't need upload/download. I really don't need multiple
message bases. A simple BBS or a terminal emulator with a host mode
(e.g. Procomm) would be the simplist thing.

Most of my friends use computers, so telling them
to call with a terminal program isn't that rough on 'em.

Does anybody think KA9Q could do my trick? This is a little
more complex than I need but the overly increased functionality
might be useful/interesting.

Thanks,
Toneeee

In a previous article, ncrawler@bluemoon.rn.com (Steve Goldfein) says:

>Could someone tell me how to go about getting a list of the ST and Atari
>8-bit software on these systems? Also, how to get a listing of the files
>in the Atari 8-bit archives at the University of Michigan. I am new to
>this, and need explicit instructions.

Usually there is an ASCII file called index or Index (case sensitive)
within the top directory. Usually this is an ls -lR > Index. Simply
a dump of the directory tree into an ASCII file. Some places like
atari.archive.umich.edu have well maintained index files within each
subdirectory. These have english descriptions of the files because
filenames often say little about the contents.

ftp atari.archive.umich.edu
cd to the 8bit section
recv index (or Index)
bye

print out the index file you received, and go nuts!

If you are looking for FTP archives, Jon Granrose keeps an excellent
FTP list.

ftp pilot.njin.net
cd ftp-list
recv ftp.list (and archie info since Jon will not continue service past
December.)
bye

print ftp.list and raid the world archives!

I am not up with the BBS scene, but years back I played with STadel
(Shareware or PD.) It was pretty easy to set up. Should suit your
purposes... Just my $0.02. Take it for what it is worth.

Jim

You might try getting a copy of MINI-BBS found at atari.archive.umich.edu.
There are a couple versions there (and the filenames don't help much
in terms of which is the newest one). But it is a VERY simple-to-set up
BBS and small too. Now if I only could afford my own phone line (not
my parents)...

>Is this some weird UNIX implementation of Atari or what? The package does
>look nice and complete, though.
>

I would assume that Atari is shipping Unix to the customer(s)
already installed on the hard drive. This does two things:
eliminates (at least partially) the need to hand-hold new sysadmins
through the installation process, and provides a (nearly) standard
initial setup for all ASV systems.

Right now a 340mb drive is running around US$1000, which is around
1600DM - so in essence you're paying US$1650 for SysV. A decent
deal (if I wasn't such a starving student, and if I already had a TT
(somewhat related to [1] :-), I would grab it right now. [How's that
for a qualifier? (grin).

3375. many misc questions

Newsgroup: comp.sys.atari.st
Date: 1991-10-09 17:47:01 UTC
From: M19701@mwvm.mitre.org
Message-ID: <91282.49621.M19701@mwvm.mitre.org>
Source record: 228202

Greetings and Salutations. This is a first attempt at posting as we recently started subscribing to NetNews, however being a long time ATARI fan but greatly out of touch with whats going on I'm glad I finally seem to have the means to catch up.

Background. I currently own several ATARI machines. Two dust gatherers, an 800 and a 1200XL, and a 1040ST (have had since 1987). Perifs include both color and mono monitors, an auxillary floppy drive, a Fast 80 Meg hard drive, an old Gemini (old but faithful) Star 10X, and a Royal typewritter with computer interface. The 1040ST has never been modified or repaired which is somewhat amazing after 5 years of use and being dropped down a flight of stairs

Questions. My main questions revolve around the need/desire to upgrade to one of the newer, faster, more complex machines or to update the 1040ST. Being new doesn't mean being naive, so I'm certain that, as the sun rises more or less in the East, that this topic has been repeated on numerous occasions.

1. Is it better to upgrade to a newer machine or update 1040ST?
2. If I upgrade, which machine is recommended and why? I'd like to keep as much hardware and software compatibility as possible.
3. If I update 1040ST, what updates exist and are they worth doing to a 5-year old machine? (It ain't broke so don't fix it mentality) Again, I'd like to maintain compatibility with what I've got.
4. If I upgrade, is there Networking software available so the kids can use the 1040ST while I use newer machine or another 1040ST?
5. Will the Packard Bell (PB9815) Laser Printer (LP) work w/ ATARI computers? My local price club has them for $350 (yes, $350). Tech sheet says it can emulate the HP Laserjet II and the IBM Proprinter X24E/XL24E. Seems like it should work with proper driver? Anyone have driver? Do I need more memory in computer? I've seen where some LPs need a minimum of 2 Meg to work, but is that within computer or a buffer in LP. PB9815 has 1.5 MB ungradable to 4.5 MB.
6. Since old faithful is only a 9-pin dot matrix, my wife and kids are getting on my case about getting a new printer anyway. Would a 24-pin dot matrix be a better buy or the above laser (if its ATARI compatible)?

Thats it for questions, but as you can see, what I need is input, opinions, ideas, comments, help, etc. from fellow users. I enjoy the machine I have and have found it to meet my needs far better than many other machines (I use a Mac IIci at work but have no need for that much machine at home). The invest ment I have in hardware and software has at times upset my wife (sound familiar to anyone else) so upgrade/update vice a new system is my optimal choice.

Thanks now for your responses. . . .
Live long and prosper . . . . . .

3376. Crashing Megafile at STE

Hello,

a friend of mine sold his Megafile 30 to another friend of mine using
a STE.

Both Systems worked fine before, but now this combination crashes frequently.
He uses AHDI 1.7.

Is there any known problem with this configuration ?

Thanks for any answer

I have the same drive (nice drive!), with a BMS-200 board (nice board!). I
was told by the BMS guys that the ROM in the Micropolis has to be told to do
a physical reset upon power up, and the ST doesn't provide this signal.
Micropolis has a replacement ROM which will fix the problem, or you can keep
using the workaround you've discovered. Micropolis sent it to me free.
Apparently Macs can exhibit the same problem.

I have some text files and some postscript files I need to send to a printer to print. They are large and the postscript contains some complicated (like any postscript isn't) routines. If the printer has to do too much processing of the postscript, it pauses the data transfer. If the pause is too long, the computer just gives up trying to send the data to the printer. Help, what can I do? The printer could be connected to the serial port, is that my solution? Is there some piece of software which is smaret enough to poll the printer port and ignore the machines port isn't working status, or.....?

Machine is 4 Meg STe.

Message-ID: <1991Oct9.195139.19819@lonex.rl.af.mil>
Source record: 228203

I am seriously considering an offer I have received to buy a used Supercharger.

It is the newer model, with 1.4 version Software and has an 8087 installed.

I know it won't be a speed deamon, but will it run programs like Quicken
at an acceptable pace, I'm told it pushes a blazing Norton SI of 4.

Also, if I buy this, can someone tell me something about the 286 expander
that is supposed to be available for the SC? Is it on the market yet?
Anyone upgraded their SC with it??

Please let me know if you have any opinions on this, as I will make a decision
fairly soon. Thanks in advance!

I have a Mac version that is a couple of years old that I use with Spectre. It emulates some terminals other than the adm31, but the emulations are buggy. Also, it does not have the kermit or capture that the ST version has (although the documentation promises them).

If anybody knows of a newer version for the Mac, I would also like to know where to get it.

>
>Can't really generalize further.

(A) Under $2000, not including printer.

(B) I'm interested in DTP, word processing, and programming.
Naturally, I don't mind a few (or more than a few) games, but this is
not my primary reason for looking at the ST.

I'm also seriously looking at 386SX PC clones. I've used & programmed
PCs extensively, and I'm not too thrilled about having to stay with
one. So I've been looking into alternatives including the ST and
Amiga.

I checked with a local dealer and he quoted me a price of $1499 for a
Mega-STe with 2 meg memory and 50 meg HD. This is a bit steeper than I
had anticipated (especially since Atari monitors are close to $400).

That's nothing unusual (well at least if Germany is playing ;-)), because Atari
Germany is doing a lot of those soccer ads. E.g. in every 1st league match
here in Germany they have those Atari ad-boards standing around.

>I tried the number in the 'Welcome to comp.sys.atari.st...' file to find
>out about a developer's package, and wasn't able to get through (I got a
>'this number has been disconnected' message) I have searched a bit through
>magazines and online texts, and have found almost nothing.

The following is an excerpt from 'Welcome to comp.sys.atari.st' posted to this newsgroup. I added the new number for the Atari Rep. person. I have the forms that I requested but have not sent them in yet for the Dev. Kit.

excerpt:

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568 - number disconnected
new # is (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

Chuck

3387. Re: Tracker .MOD files source

Right, but I will recommend you to get the Audio Sculpture, which is a *very*
much improved Noisetracker. It is not PD, but it is far more competent than
any of the Public Domain trackers out there. And it handles almost any MOD's
thats around. It have been avalible in France for some time now, and the
brittish manual should be ready by now.
Naturally works on ST,STe and TT, color or mono. Really a hit. Handles
MIDI and 16 bit output too (maximium 50kHz).

Just in case you want the best, check Audio Sculpture out (even though it
may cost you approx $100)

hmmmmm..... Isn't the art of programming taking advantage of hardware
anomalies ? Or do you have a twisted belief that everything in the
Crikey demo could have been done with VDI calls? Not to start a
argument on OS vs. Hardware programming methods [I already did that on
alt.amiga.demos, some time back]. I applaud Lost Boys and all the other
demo groups out there for their originality and programming skill.
It is NOT bad programming technique, especially since you simply
cannot get graphics like that any other way. PERIOD!!
It's that same 'bad' programming that has given us Spectrum 512,
ST Protracker [and other 4-voice sample driven music players for the ST],
overscan [which I would like to see implemented in a program like CyberPaint
eventually], and the most brilliant games on the ST. If you want to see
a good example of bad programming, take a look at GEM!

Paul Steffen
[STratoHACKster of TPPI! Check out our upcoming Amiga/ST demos]

ps. I just remembered that I have one of the older shifters in my ST
and Crikey works flawlessly as far as I can tell.

3389. Hot demos

Newsgroup: comp.sys.atari.st
Date: 1991-10-09 23:44:18 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1991Oct09.234418.10576@usenet>
Source record: 228213

There has been some discussion lately about all the outrageous graphic and sound demos out there. I am wondering if a few of you out there could recommend a few of the best. As most of these files are several hundred k in length, at 2400 baud I can't really just grab 'em all and see what's neat.

Any recommendations for stuff with really cool graphics and/or sound (that would make my mac-owning roommate even more jealous) would be appreciated.

BTW, I have both color and mono, and an early ST (ie STe demos don't help me very much)

Thanks,

John Thaanum thaanuj@prism.cs.orst.edu

3390. trackers

Newsgroup: comp.sys.atari.st

Source record: 228214

I've seen a few tracker players that run in monochrome. A friend of mine
wrote MarxTracker which is on atari.archive. I haven't gotten
around to sending his later [and MUCH improved] version, tho.
He still needs to speed up the play routine a bit and fix looping.
He already has re-written most of the code. There is also a nice
tracker player that runs on monochrome and plays at 26.3KHz but it
doesn't support volume [which is rather important].
I'd certainly like to see a Soundtracker editor that runs on monochrome
and supports MIDI note entry.

By the way, that ProTracker that was just uploaded to atari.archive is
excellent!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

With the DC AtariFest just a couple of days away, I'm trying to decide
how to put myself in the poor house and was wondering if
I could cram say a T16 accelerator *AND* PC-Speed (or any two similar
products) inside my Mega ST. Has anyone out there done this?
I assume I'd have to stack one on top of the other as they both plug into
the 68000's socket and provide a pass thru. Is there enough clearance?
Will the work together?

P.S. I know that the T16 won't make PC-Speed any faster, but are they
compatible?

I'm having trouble getting this demo to work. The 'Please wait'
comes up OK, but the main screen flickers badly and is unreadable. After
pressing reset, the information screens are OK.

I'm using: 4 Meg STe through RF modulator

I MSA'd both of the files and did get a correct disk as far as I know.

Please email me any suggestions on how to get this to work.

Thank you very much especial to the gentleman from NASA (sorry the mailer delete the message when I exit from it and forgot to save it to mbox).
I have received a copy thru Email and got Jon's TT up and runing using the new AHDI.
While getting TT runing, we run the GCR with spectre 3.0 version on it.(3.0 will run but only use the 2MB on the motherboard and it's ST RAM so the speed is not very high). Boot up Mac OS 6.0.7 in Mac Plus mode then run the speedometer, it reported 030 found and average 2.0 times Mac. If it can run from the TT RAM, the speed should be higher.
Also noticed the new color monitor for TT does not use the full screen, it seems to have a lot of boarder area. Is there something to adjust the screen display area?

A slight correction is needed here Bob. The SST Gadgets Board allows
up to 12 meg, any program written properly can take advantage of it. Also,
there is at least one German board that allows up to 12 meg, but converting
from German fund's (which in this case is appropriate, as no one in NA
makes one) it would cost about as much as a TT.

>>
>hmmmmm..... Isn't the art of programming taking advantage of hardware
>anomalies ?

No. It isn't. It's art to play by the rules and create beautiful
programs that work reliably.

>Or do you have a twisted belief that everything in the
>Crikey demo could have been done with VDI calls?

Did I SAY "only programs that use VDI calls are properly programmed"?
No. And in fact there are many "portable" ways to do fast graphics on
the ST/TT that, at least in the sense that the code will run on all
Atari ST series machines (which many demos will not). Some methods are
more portable than others.

>Not to start a
>argument on OS vs. Hardware programming methods [I already did that on
>alt.amiga.demos, some time back].

Well, you are again.

>I applaud Lost Boys and all the other
>demo groups out there for their originality and programming skill.

And what a world of good they have done for the ST community by writing
software that is neither stable nor guranteed to run on all existing
ST's, much less future Atari machines.

>It is NOT bad programming technique, especially since you simply
>cannot get graphics like that any other way. PERIOD!!

No, it IS bad programming technique, because you CAN'T get graphics
like that on the ST, PERIOD. They have tried and failed. I don't
count "graphics that only work on some people's machines and not
others" as "working." Would you accept a spreadsheet program that
exploited some weird bug in certain 68000 chips to calculate faster,
but only ran on some subset of machines? No, you'd call the company
that made the spreadsheet and tell them to fix their brain-dead
program. (And the Lost Boys would respond, "But gee, it's FASTER that

way." It's the same as, "But gee, I got more colors on the screen that way." Forget it.)

>It's that same 'bad' programming that has given us Spectrum 512,

...which doesn't work on non-8 mHz machines. Fat lot of good it does those with faster CPU's. How about the people who paid good money for Spectrum 512 and now can't use the program any more?

>ST Protracker [and other 4-voice sample driven music players for the ST],

There's nothing inherently nonportable or unreliable about trackers.

>overscan [which I would like to see implemented in a program like CyberPaint
>eventually],

...which you won't see in a program like Cyber Paint because no sane company is going to market a product which doesn't work on all machines. (This is starting to sound redundant!)

>and the most brilliant games on the ST.

OK, name the most brilliant games on the ST. Make sure you specify the undocumented graphics mode and/or scrolling technique that each game uses. Remember, there's nothing wrong with software blitting to screen RAM (which is what most games do, obviously), because such techniques are not shifter-dependent or monitor-dependent. (Although they are typically machine-dependent, in that you can't port them easily to other platforms.)

Speedball II doesn't use any of those techqniues. I guess the Bitmap Brothers just aren't getting "everything out of the machine." Yeah, what losers...

>If you want to see
>a good example of bad programming, take a look at GEM!

Remember, I never said that relying on weird hardware anomalies was the ONLY kind of bad programming, I just said it was ONE kind of bad programming. So GEM is totally irrelevant.

>[STratoHACKster of TPPI! Check out our upcoming Amiga/ST demos]

If I may make a humble suggestion, why not use your time and programming talent to write a useful application. You will be helping the Atari/Amiga communities and may make some money at the same time.

>ps. I just remembered that I have one of the older shifters in my ST
>and Crikey works flawlessly as far as I can tell.

Good for you. The whole point is that since that undocumented shifter techniques aren't guaranteed to work on ALL ST's, so just because it works on your test machines does not mean it'll work on my machine. NONE of the Lost Boys/Care Bears/etc. demos that have been posted to atari.archive work on my machine, which is an unmodified ST. This is

really no surpise, since "undocumented" often means "won't work on all machines."

>drives. Is this true? What kind of problems might I have with
>the Quantum that I might not have with a Seagate?

I have a buddy with a 3.5" 105mb Quantum hooked to his ST (along with a 320mb Hitachi and a Syquest SQ-555!). It works very well, he has no complaints. The only thing you might find problems with is hard disk driver software that for some reason does not allow you to use a Quantum. Since the ICD unit (which Toad and my buddy use) works fine with the Quantum, you are ok. All other software should work fine (since it is actually talking to the ICD host adaptor).

These are different mod files. The Amiga ones are Noisetracker files. The Soundtracker comes with a conversion program that can convert most Noisetracker files to the Soundtracker format, but files created specifically for the Soundtracker sound better.

The Soundtracker has an "Amiga mode" button to allow one to use Amiga samples. The native Soundtracker sampling rate is higher than in the Noisetracker, so Noisetracker samples sound too high and fast.

3400. Ghostscript with bj10 printer

Newsgroup: comp.sys.atari.st
Date: 1991-10-10 06:02:33 UTC
From: marshall@cs.uq.oz.au
Message-ID: <4297@uqcspe.cs.uq.oz.au>
Source record: 228233

I tried to run ghostscript 2.3 on a 1040st, 1meg ram, TOS 1.0.
With epson it worked OK - at least, it produced an output file.
With the following command line it failed:
gs -sDEVICE=bj10e c:\gs\ps\filename.ps
it produced the following message:

Initializing ... Unrecoverable error: unknown error in setdevice
Operand stack:
--nostringval--

Is this due to lack of memory, or old TOS1.0, or is the bj10e driver buggy?
Incidentally, on my epson 9pin clone, the output is garbled - but it is only
a clone. Help would be greatly appreciated.

In <5251@chalmers.se>, Per Anders Olausson writes:

Hi,
> The problem I'm experiencing is that when I power up the system won't boot
> and I always have to do a reset manually (after the cold start has finished)
> and the it works ok. (the 1375 drive does spin up, though, at power up)
sounds quite familiar to me. I think you have one big switch for all
machines, right? Well, the hard drives need some time to spin up. This time
differs between 2 seconds for a Quantum SCSI, 8 seconds for a Seagate SCSI
and up to a minute for very old drives.
If you switch on the Atari, the first thing it does is checking the boot
sector of drive A: and execute it (if the boot sector is executable).
The next thing the Atari does is to check if it can boot from a HD. At this
time, your drives are not ready because they didn't have enough time to
spin up to full speed. So the Atari will boot from drive A:.
When you do a reset, your hard drives had enough time to spin up. When
checking for a HD, your Atari will find them this time and boot from
your HD.
The second explanation may be the "drive not ready" message from some HDs.
They send a message to your Atari to tell it they're spinning up and the
computer should wait a few more seconds. Unfortunately, the Atari doesn't
understand this message, and thinks there is no HD. This is a typical
problem for Quantum users. Thank goodness you can tell Quantums to stop
sending that message.

The solution is to switch on everything except your Atari, wait approx. 30
seconds and turn on the Atari. If the Atari now boots from your HD, your
problems are ended. If you hate to use two switches, check out for a programm
called "WAIT_HD.TOS". It writes a small programm into the boot sector of
drive A:. If you have that disk inserted at boot time, the Atari will
execute this programm before checking for a HD. And this programm doesn't
terminate until the HDs are ready. When the Atari checks for the HDs, they
had enough time to spin up (thanks to that programms) and boots from HD.

If this doesn't work, try to get technical informations for your drive
and find out how to stop it from sending the "drive not ready" message.
/s/
PS: There are several programms creating a "hd-wait" bootsector. TT and
Mega STE users should use NORORACH from Atari Corp...

i

Mickey , both NoiseTracker AND Soundtracker files are available on ab20.
The reason that some NoiseTracker files may sound too fast is that they
were created by European Amiga hackers who have PAL Amigas. Thus their
MODs are designed to be run at 50 Hz so when they are played on NTSC
machines that run at 60 Hz they sound too high & fast. Most Amiga
MOD players have a PAL/NTSC switch. If you are looking for purely Atari
created MODs you are going to have a long wait since SoundTracker and
NoiseTracker were originally written for the Amiga and Amiga owners are
the sources of almost all MODs.

>hmmmmm..... Isn't the art of programming taking advantage of hardware
>>anomalies ?
>
>No. It isn't. It's art to play by the rules and create beautiful
>programs that work reliably.

That almost sounds Orwellian. Anyway, who sets these rules? Atari?
We'd still be in the dark ages! The ST is certainly capable of
multitasking but any decent low-level implementation of it is
going to break some rules. [i.e. Mystic Formatter and Shadow, not
STalker] GEM/TOS is inflexible and should have been replaced the
minute Atari found a better OS. TOS is basically MS-DOS implemented
on the 68000! Call for call!

>
>>Or do you have a twisted belief that everything in the
>>Crikey demo could have been done with VDI calls?
>
>Did I SAY "only programs that use VDI calls are properly programmed"?

>the ST/TT that, at least in the sense that the code will run on all
>Atari ST series machines (which many demos will not). Some methods are
>more portable than others.

Well, as far as Atari is concerned, it is. [unless you were talking
about a different set of rules..] Yes, there are more "portable" ways
to doing things but, the more portable [generalized] a routine gets,
the less effective it is on individual hardware. You can't do much
if you are writing for the lowest common denominator.

>>Not to start a
>>argument on OS vs. Hardware programming methods [I already did that on
>>alt.amiga.demos, some time back].
>
>Well, you are again.

Such it is.

>>I applaud Lost Boys and all the other
>>demo groups out there for their originality and programming skill.
>
>And what a world of good they have done for the ST community by writing
>software that is neither stable nor guranteed to run on all existing
>ST's, much less future Atari machines.

I find ST demos to be generally more stable than most application
software. I have never had an ST demo crash on me. Shifter-
incompatibilities only cause slight flickers in the overscan areas
[or no overscan graphics at all].

>>It is NOT bad programming technique, especially since you simply
>>cannot get graphics like that any other way. PERIOD!!
>
>No, it IS bad programming technique, because you CAN'T get graphics
>like that on the ST, PERIOD. They have tried and failed. I don't
>count "graphics that only work on some people's machines and not
>others" as "working." Would you accept a spreadsheet program that
>exploited some weird bug in certain 68000 chips to calculate faster,
>but only ran on some subset of machines? No, you'd call the company
>that made the spreadsheet and tell them to fix their brain-dead
>program. (And the Lost Boys would respond, "But gee, it's FASTER that
>way." It's the same as, "But gee, I got more colors on the screen that
>way." Forget it.)

Interesting logic. You are telling me that I can't get 512 colors
with Spectrum because Spectrum doesn't run on a TT? You are a C
programmer, I take it. You obviously aren't familiar with hardware.
The ST is different from the STe and the STe is different from the TT!
There will ALWAYS be incompatibilities. You just simply cannot do
anything about that. So, you are telling me that I shouldn't even
ATTEMPT anything that might be incompatible with a newer model...
By the way, don't you think that a TT user would appreciate a 68030/
882 specific spreadsheet more than one that runs on all Atari's?

>
>>It's that same 'bad' programming that has given us Spectrum 512,
>
>...which doesn't work on non-8 mHz machines. Fat lot of good it does
>those with faster CPU's. How about the people who paid good money for
>Spectrum 512 and now can't use the program any more?

Well, Tri Engineering could easily add code for faster CPU's.
Just like QuickST/TurboST has added code for TT resolutions. Don't know
why they haven't done it already.

>>ST Protracker [and other 4-voice sample driven music players for the ST],
>
>There's nothing inherently nonportable or unreliable about trackers.

Like I said, you must not know hardware. Tracker routines, although to
a lesser degree, are still very sensitive to cpu speed. After all, they
DO have to process 4 separate digital samples and mix them into 1 and
then directly access the AY chip.

>>overscan [which I would like to see implemented in a program like CyberPaint
>>eventually],
>
>...which you won't see in a program like Cyber Paint because no sane

>company is going to market a product which doesn't work on all machines.
>(This is starting to sound redundant!)

Yeah, it is getting very redundant! Especially since you don't seem to know what you are talking about. Did you know that the author could simply adapt his code to overscan on a TT? Didn't think so.
Overscan would CERTAINLY make the ST more useful for video production.

>
>>and the most brilliant games on the ST.
>
>OK, name the most brilliant games on the ST. Make sure you specify the
>undocumented graphics mode and/or scrolling technique that each game

I wasn't talking specifically of graphics modes [there are no undocumented graphics modes, by the way] or scrolling techniques. I do know of the scrolling technique by offsetting in overscan. I have know way of knowing if this rather ambitious technique is used on any games software for scrolling. I do know that quite a few games [particularly Psygnosis] use far more than the 16 allowed colors for low-res mode which means raster interrupts. Disk loading during animation/sound means custom DMA routines [Dragon's Lair, Space Ace...]. These are only the obvious since game developers don't give out their tricks.

>uses. Remember, there's nothing wrong with software blitting to screen
>RAM (which is what most games do, obviously), because such techniques

There's nothing wrong? This is another gray area because this technique will most likely cause problems on future ST's, if not already. Stacy?

>are not shifter-dependent or monitor-dependent. (Although they are
>typically machine-dependent, in that you can't port them easily to
>other platforms.)

Of course. But it really depends on how far the Atari ST compatible line expands.

>Speedball II doesn't use any of those techqniues. I guess the Bitmap
>Brothers just aren't getting "everything out of the machine." Yeah,
>what losers...

Do you know the BitMap Bros. personally. Overscan offset scrolling moves the whole screen and would be completely unusable for the playfield scrolling in SpeedBall II. One can still do amazing things with optimized assembly routines.

>>If you want to see
>>a good example of bad programming, take a look at GEM!
>
>Remember, I never said that relying on weird hardware anomalies was the
>ONLY kind of bad programming, I just said it was ONE kind of bad
>programming. So GEM is totally irrelevant.

Yes, BAD is an opinion. It takes ALOT more skill to write a good
demo. An INCREDIBLE understanding of hardware and mathematics.
These guys know EXACTLY what they are doing regardless of how
unorthodox it may seem to you.
>
>>[STratoHACKster of TPPI! Check out our upcoming Amiga/ST demos]
>
>If I may make a humble suggestion, why not use your time and
>programming talent to write a useful application. You will be helping
>the Atari/Amiga communities and may make some money at the same time.

What? Demos AREN'T useful? I personally know 2 people who bought their
ST because of being impressed with a graphics demo. I think that's
helping the Atari quite a bit.. [The Lost Boys may be responsible for
more sales of ST's than Atari's own lame-brain advertising campaign..d:^]
I program for the enjoyment of it. Several musicians DO play music for
the enjoyment of it, why not programmers?

>
>>ps. I just remembered that I have one of the older shifters in my ST
>>and Crikey works flawlessly as far as I can tell.
>
>Good for you. The whole point is that since that undocumented shifter
>techniques aren't guaranteed to work on ALL ST's, so just because it
>works on your test machines does not mean it'll work on my machine.
>NONE of the Lost Boys/Care Bears/etc. demos that have been posted to
>atari.archive work on my machine, which is an unmodified ST. This is
>really no surpise, since "undocumented" often means "won't work on
>all machines."

Well, if your computer is anything other than a standard 520st or 1040st,
I might believe you. I could never believe that all these demos
wouldn't work. Try downloading the MSA files in binary. d:^)

>Dave Baggett
>dmb@wam.umd.edu

Paul Steffen

ps. 'undocumented' means everything Atari neglected to document.

3404. GDOS: Metafile fonts, drivers, etc

Newsgroup: comp.sys.atari.st
Date: 1991-10-10 11:34:44 UTC
From: J.M.C.Geada@newcastle.ac.uk
Message-ID: <1991Oct10.113444.19702@newcastle.ac.uk>
Source record: 228181

Does anybody out there know how to produce the metafile font
information ?
I have GDOS, & have been able to get some fonts & even design
some bits, but so far have seen no way of generating the
metafile version of the fonts.

Is there an easy way of converting fonts from one resolution
to another (eg screen font-> printer or vice versa) ?

Where can GDOS printer drivers be obtained ? I have recently
bought a Canon BJ10e bubble jet printer (great printer!) and
at the moment am using a 24pin printer driver, but this does
not seem to be an ideal solution.

Thanks for all answers

Joao

From: Jan.Willekens@p12.f202.n281.z2.fidonet.org
Message-ID: <fido_2_281/202.12_28f4323d@linn.fidonet.org>
Source record: 227957

In a message of <04 Oct 91 16:48:45>, data3d@aahs.no (Karl Anders 0yga (2:320/100.1) writes:

d(> Existing owners of Atari TTs may purchase Unix for around 15000NOK
d(> (divide by app 6.5 for price in dollars, 11 for GBP). The unix comes
d(> in shape of a readily installed 210 meg harddrive. The unix is
d(> system 5 compatible and comes with xwindows and a lot more.

Indeed, the Unix is Atari's implementation of AT&T's Unix System V Rel. 4.0.
It comes with XWindows 11.4 and OSF/Motif 1.1. Through Ethernet the system can
be connected to TCP/IP, NFS and RFS networks.
So the package contains:
Atari System V Release 4
Virtual File-System (VFS)
Device Driver Interface (DDI)
Device Kernel Interface (DKI)
X Window System Release 11.4
OSF/Motif user interface
X Facemaker 2
WISh2 Desktop
FSF GNU C Compiler (ver. 1.39)
FSF GNU C++ Compiler (ver. 1.37)
FSF GNU gdb debugger (ver. 3.5)
Symbolic System V debugger

When you also buy the network package you also get:
Network File System (NFS)
Remote File Sharing (RFS)
TCP/IP (DAPRA protocolls)
BSD connection

Documentation (developers package):
ATARI Style Guide
The ASV Developer's Guide

Supporting Literature:
AT&T Unix System V Rel. 4 (publ. AT&T & Prentice Hall)
OSF/Motif Version 1.1 Manuals (publ. Prentice Hall)
X Window System

d(> The unix is very stable, and compared to the Apples pathetic A/UX
d(> and the rather buggy unix that Commodore deliver with their 3000UX,
d(> the TT Unix is a clear winner. Whether it will run in conjunction
d(> with an SST '030 board is unknow as of yet.

It indeed runs stable, but you will have to have a LOT of memory (RAM) otherwise the operating systems starts trashing. (continiously writing and reading to/from hard disk, so the OS is busy transferring memory blocks to.from hard disk most of the time) I btw found it quite slow, but then i am not used with working with Unix machines, so it might even be the standard speed.

I'm in a very similar situation - I've been out of the scene since I
sold my ST to a friend 2 yrs ago, but I'm about to borrow it back.

I would like to know:

1 Is there a decent word-processor for a 1040 now? I only had 1st Word Plus.

2 How about a C compiler (on a single floppy machine)?

3 What's the best command-line shell around now?

4 Are hard disks still the ridiculous price that they used to be?
(I've been spoiled by the PC world!)

5 Lastly, is it easy to expand the RAM on a 1040ST?

Many thanks,

Thanks to all of you who expressed interest in Perl 4.010 for the
atariST. I worked on it some more, and i think i have a fairly
reasonable port now. I have sent the diffs, config.h, makefile,
support files, the Perl executable, and some support utils to
atari.archive.umich.edu. Please see the file README.ST and RESULTS
in the .zoo archive for more details. Please beat on the port a little
bit and let me know how it does under stress. I will give this process
a little time, so that we can squeeze of any major problems, and then
send in the diffs to larry for merging into the perl distribution.

The files are available for anaonymous FTP from
atari.archive.umich.edu:atari/languages/perl4_10.zoo
(as per conventions on A.A it will also be availble in atari/newitems for
some time). Thanks to jeff weiner@atari.archive.umich.edu for his
assistance with makeing the files available.

Last but not the least, major thanks to larry wall for his great
software.

cheers,

g(> Oops, I left out one quetion. Do these Mega-Demos use some sort
g(> of video mode that I am unaware of or something. I have to adjust
g(> my Vertical-Hold knob on my Multi-Sync monitor when I run most demos.
g(> This is not a complaint! I am just curious if I am missing out on a
g(> special video mode (I do a little Assembler dabbling myself).

Hihi, no they do not use a special, hidden video mode. They only use a lot of techniques in order to achieve border removal and sync scrolling. (scrolling large areas of graphics on a normal ST using almost no CPU time) These techniques involve switching between 50/60/71 Hz depending on the current location of the electron beam. So they indeed sometimes switch to 71Hz (monochrome) on a color monitor. This probably causes the tiny problems you have with you multisync. It causes no damage to your ST or monitor, by the way. But i guess that the 71Hz switching causes your monitor to 'desync'.

By the way, great demo, eh?

>> hardware (cards..etc) is required?

>ANY Atari ST is limited to 4 Megs of RAM.. period. Doesn't matter what
>combination of hardware, cards or chips you want to use, 4 Megs is IT.

While this limit has been correct until now, there are, at least over here
in Germany, companies that offer plug-in (or was it solder-in) cards with
up to 16 MB (which is IT for MC68000 processors). Of course you can "only"
use app. 15 MB of that because of TOS ROMs and memory-mapped IO. What I know,
however is, that the (strange, sightless, ...) 4 MB limit has been broken
for ST computers - if you have the money.

However, for the standard upgrade, 4 MB is indeed the upper limit.

BTW, as of which board revision is upgrading difficult? This important
tidbit of information was missing from your answer.

So long

The problem with getting the OS on a pre-installed drive is two fold:-

1) On a tape or floopy distributed system you only load that which you need,
which means that you don't waste valuable disk space.

2) What happens if/when you get a head crash, what are you going to boot from?
Whow are you going to re-load the system, and what from?

Pre-installed drives are all very well for the sealed unit retailers, but what
about later when the drive breaks!

Steve

> had anticipated (especially since Atari monitors are close to $400).

Well, that IS a bit steep. Ye Local Computer Shoppe is selling 2meg Mega-STEs w/50 Meg HD's for $1295. As for monitors, if you're doing DTP, what you really want is Atari's outstanding mono monitor, the SM124, which runs about $160. Atari's colour monitor is OK, but has never been mistaken for an NEC Multisync.

You've picked the right hardware. Now all you need is Calamus for DTP, Word Perfect for WP, and one of the million excellent C programming packages available for the ST.

>>
>>Supposedly, they are faster, quieter, and cheaper than Seagate
>>drives. Is this true? What kind of problems might I have with
>>the Quantum that I might not have with a Seagate?

The SPARCstation 1+ which I use has two 105 MB Quantum drives in it for booting. Occasionally, the heads will stick in the resting position when the drive is first powered up. The Sun OS then goes through a second reboot in an attempt to free the heads. This has corrected the problem in the past, though other Quantum drives have had to be removed from their Suns and tapped lightly to free the heads (one instance where a kick to a computer has been beneficial).

Some Quantum drives have a tendency for the heads to stick in the resting or off position when powered up. While this is not much of a problem for a workstation (many are not routinely turned off and on), it may present a problem for an ST, which is usually turned off when not in use.

I do not know how common this is but it has been discussed in the Sun newsgroup. And, one of the two drives in my Sun at work has this problem. Quantum has probably fixed this problem by now, but consider it.

>created MODs you are going to have a long wait since SoundTracker and
>NoiseTracker were originally written for the Amiga and Amiga owners are
>the sources of almost all MODs.

Thanks for the info. In actual fact however, I already have about 15 mod files composed entirely on the ST using ST Replay samples. They sound much better on the ST than any of the converted Amiga mod files I have heard (don't get excited Amigites, the Amiga files probably sound great on an Amiga). I wonder if the Amiga Soundtracker is also made by MPH?

Here is the pertinent chunk of the TCB manual:

AMIGA The -TCB TRACKER- uses a sampling resolution of
10 KHz. The Amiga samplings only uses 8.3 KHz.
When you play a converted Amiga module in the
-TCB TRACKER-, the pitch will be too high so
all samples will sound like Donald Duck. The
remedy is to activate this icon. This
will bring the -TCB TRACKER- down to the Amiga
level. The effect is almost like pressing the
Dolby button on a tape recorder.

This seems to deal only with the samples themselves, not the playback speed of the mod files. I could not find any mention of differing mod playback speeds.

Also, if I buy this, can someone tell me something about the 286 expander
that is supposed to be available for the SC? Is it on the market yet?
Anyone upgraded their SC with it??

I just received a fax from Condor Computer Ltd in UK about the SC.
They have the 286 expansion ready for delivery.
It has an optional case with two 16bit expansion slots and two
versions, 12 MHz (Norton rate 12) and 16 MHz (Norton 15).
The slots can handle VGA-boards, Serials, Parallels, Game ports, Sound
boards, Graphic expanders, Floppy drivers and HD-drivers, for example.

Prices are: (in English Pounds)

Upgrade board only
12 MHz 120.00
16 MHz 165.00

Board plus optional metal case (6.0"W X 5.75"H X 9.5"D)
12 MHz 235.00
16 MHz 280.00

Please let me know if you have any opinions on this, as I will make
a decision fairly soon. Thanks in advance!

I think it is the best available now. (Omega's Delta Modul has serious
problems, not yet available) And it is compatible with all Atari
computers from 520 ST to TT030.
Personally, I am waiting for the 386sx expansion board, and the
optional AT-tower case with 2 + 6 full-size expansion slots. Should be
available for SC this year. Germans are already advertising it...

It looks like we are about to get a new generation of USENET users in comp.sys.atari.st. The bombardment of computer sales over this facility tells me that the experienced (but not developer) users are leaving atari for more prestigious computer systems. This is great news because we should see a new wave of enthusiastic users who got a really good deal on the computer that provides power without the price (and in this case really without the price).

This prompts me to re-encourage us to make the atari archives as user friendly as possible. This includes documentation to set up

- MiNT
- command line editors/shells (bash, gulam, ksh)
- TeX/LaTeX
- Uniterm Macros
- Sozobon C (I think the easy to install package already exists)
- GNU C
- g++

Also, its time for us to be flame-retardent. Don't flame, and when you see a flame skip it (I use the "k" functions of rn).

Thanks for your time.

The 105meg Quantum hooked up to my 52meg Quantum (a replacement
of the 49meg Seagate that developed "stiction") inside the ICD
FAST drive case works flawlessly. Both of them are fast and
quiet. The only thing that gave me a bit of trouble was that you
must remove a jumper before the Quantum (either one) would be
"visible" by the ST.

>demo. An INCREDIBLE understanding of hardware and mathematics.

Mathematics? Come off the grass! What are we talking about here? Addition?

Hardware? I agree. They know all about _their_ box of bits. They probably know more about the ST than most other programmers. With their faces so close to the metal, there is no surprise they cannot see the virtual machine, which they should be programming on. I program for enjoyment too. And one of the best feelings is seeing stuff work on the TT, even low-level stuff that works in the TT resolutions (well, now I've got someone's to test on :-]).

I see you didn't mention "software".

>These guys know EXACTLY what they are doing regardless of how
>unorthodox it may seem to you.

Face it Paul, it IS unorthodox. Everyone agrees with that.

>I program for the enjoyment of it. Several musicians DO play music for
>the enjoyment of it, why not programmers?

Fine. Me too. But just keep the code to yourself.

Source record: 228250

OK, lets jump on this demo bandwagon. The statement has been made that
these demos shouldn't be released etc. Well, what is wrong with that really?
Yes, these folks are on an ego trip, program 'badly' perhaps also, but what
is wrong with that?
My contention is that you are not forced to view these demos, but if you
wish to you 'may' be able to. Personally, I do enjoy sitting back and watching
these demos on my old stock '85 1040, and now my recently upgraded to 1.4 1040.
As one of the few Atari ST owners around the campus here, where the labs ooze
IBM and Macs, I have made more than a few believers out of some friends who
thought the ST was 'no good'. No , not simply by these demos of course, but
with a semi-thorogh presentation of some major applications for the ST (calamus
, pagestream etc), and also like to show these demos. Most Mac folks say WOW
when they see some of this stuff, and is there really anything wrong with that?
Hell... I have a few folks now interested in possibly buying an ST in the near
future.
To recap , this is not forced upon you to use/view. If it is not your
cup of tea, simply don't download it. I think it would be highly unfair to
limit what should and shouldn't be released however.
As to their abilities.... they enjoy what they do.... let them do it. What
may be 'useful' in one persons eyes is not in another. We live in a small enou
gh community of users as it is to start banning certain types of coding and the
like.

3435. MODS noise/sound tracker

Newsgroup: comp.sys.atari.st
Date: 1991-10-11 05:33:55 UTC
From: wdao@girtab.usc.edu
Message-ID: <20538@chaph.usc.edu>
Source record: 228002

There seems to be some misconceptions between the trackers series.
I hope the following will enlighten the misguided.
(I am basing the story on the AMIGA versions. I dont know about the ST).

First there was Soundtracker written by Karsten Obarski. It became very
popular because it allowed music to be easily inserted in one's prg.
It was somewhat buggy,the replay routine was not as optimised to the max,
a few sound manipulation was lacking.
A few Hackers then took upon the task of rewriting it (there is the myth that
somebody broke into KO's house , stole all his disks, and a few days later
the disks were sent back minus the source for the Ntracker). fixed a few
bugs , add a few commands to ease one's life , make it more efficient.
The soundtracker series was getting more and more versions, by as many
different hack teams.
New added things were like the ability to have more instruments (32 instead
of 16), better looking interface, not crashing on NTSC machines, etc...
Then some people decided to instead of reusing the same codes, adding to it,
to rewrite it totally. Protracker and Noisetracker were the ones.
They are also the less buggy ones.

bottom of the line : they are all the same program (ok, the codes might be
different, but they give the same result), use the same type of sound
samples, there is no such thing as "amiga" switch as said earlier. (it was
total delirium).
Some trackers have incorporated different timing schemes (a pal song runs
at a different speed on a NTSC machine 50hz<->60hz) so that they
sound as the author meant it to be).

again, the rule is : the newer N/S-tracker has to be backward compatible
with the older trackers. (exceptions for the 8 voices trackers among each
others).

So what are the differences a MOD player has to take care of ?
---
noisetracker or soundtracker ? aint any differences . ok ???? ok !!!

the real ones are :
16 or 32 insts ? (easy to deal with)
4 or 8 voices ? (harder to deal with)
SID like sounds ? (ok problem)
Protracker modules ? (it has some special commands) (easy problem)

Walt

[I'll only address the non-personal-attack points in here, in the
interest of keeping this out of alt.flame...]

In article <9110101126.AA08437@geech.gnu.ai.mit.edu> psteffn@GNU.AI.MIT.EDU (Paul Steffen) writes:
>
> The ST is certainly capable of
>multitasking but any decent low-level implementation of it is
>going to break some rules.

I don't see why multitasking is relevant, but I'll address the point
anyway.

According to your "fact," MiNT is "not a decent implementation." I
don't agree.

>I find ST demos to be generally more stable than most application
>software. I have never had an ST demo crash on me.

This is straight out of fantasy land. You may be able to claim that
demos are useful and that exploiting hardware quirks is fun, but you'll
never be able to make a case for the reliability of ST demos. I can't
think of a single one that even runs from a hard drive! It's not a
coincidence that every time a new demo comes out, several people post
plaintive messages to c.s.a.st asking why it crashes, flickers madly,
etc.

>Well, Tri Engineering could easily add code for faster CPU's.

Yes, to patch their code which doesn't work on all machines. Exactly my
point. You don't need to "add code for faster CPU's" if you write
programs properly the first time.

>>There's nothing inherently nonportable or unreliable about trackers.
>
>Like I said, you must not know hardware.

I've written quite a few digitized sound playing utilities, and none of
them rely on undocumented techniques. Using the Yamaha chip to play
samples is a documented technique guaranteed to work on all ST's.

The mixing can be achieved either with clever precalculation, or by
limiting the maximum playback rates. Like I said, if you have to rely
on CPU speed or hardware bugs to make your program work, you're not
doing anyone any favors.

> I do know that quite a few games [particularly Psygnosis]
>use far more than the 16 allowed colors for low-res mode which means

>raster interrupts.

You are missing my point. Hblank interrupts do not rely on undocumented memory locations or hardware anomalies. Hblanks are documented by Atari and guaranteed to work on all ST's. So they're absolutely fine. Using them is fine programming. I only said that techniques that exploit undocumented locations and hardware quirks are bad programming. The reason such things are bad is that they're not guaranteed to work on all the ostensibly compatible machines.

>Disk loading during animation/sound means
>custom DMA routines [Dragon's Lair, Space Ace...].

Bzzt! Thank you for playing -- try again. Sound routines, whether digitized or not, are typically run off some kind of interrupt, like Timer A. Thus, they play regardless of what the "foreground process" is doing. If you can write a sound/music player at all then you get asynchronous playing capability for free.

Animation can be done in the vblank, which is also interrupt-driven. No special routines are required to read from disk in either of these cases. In fact, writing your own disk routines for this is silly, because the OS routines work just fine, and (once again) are guaranteed to work on all machines. You also get hard drive support, support for removeable media, etc. for free. Why re-invent the wheel?

>>uses. Remember, there's nothing wrong with software blitting to screen
>>RAM (which is what most games do, obviously), because such techniques
>
>There's nothing wrong? This is another gray area because this technique
>will most likely cause problems on future ST's, if not already. Stacy?

No, there's nothing wrong with that, because Atari has documented the screen memory format, and it's not going to change from machine to machine. Obviously programs that manipulate screen RAM directly will be tied to certain resolutions, but that's OK as long as future machines have that graphics mode. At the very least, software blitting works on all the machines it's advertised to work on, unlike techqniues that rely on hardware anomalies.

>Do you know the BitMap Bros. personally.

What in the world does that have to do with it? I know for a FACT that they do not rely on any weird shifter bugs to scroll the screen in Speedball II. (For one thing, it runs on my ST, which is quite intolerant of shifter foolishness, as I've already mentioned.)

> One can still do amazing things with optimized
>assembly routines.

You're right, one can, and in the last few years I've seen some of the best assembly language graphics routines written for the ST. (And no, I didn't write them!) Assembly language is fine (although not as good

as a high-level language if you can do what you need in a high-level language). I agree with you that writing highly optimized assembly language blitting and scrolling routines is quite an art, and requires enormous knowledge and talent. Squeezing more colors or pixels out of the shifter chip by exploting undocumented hardware features is neither impressive nor correct. It's a failure, not a success. It just puts more broken software out there.

>What? Demos AREN'T useful? I personally know 2 people who bought their
>ST because of being impressed with a graphics demo.

I hope those people bought ST's that can run those great demos. Not all ST's can, as I have made painfully clear.

>I program for the enjoyment of it. Several musicians DO play music for
>the enjoyment of it, why not programmers?

Your analogy is excellent. You can play an instrument for enjoyment and still be a rotten musician.

>Well, if your computer is anything other than a standard 520st or 1040st,
>I might believe you. I could never believe that all these demos
>wouldn't work. Try downloading the MSA files in binary. d:^)

Thank you. I do know the difference between "binary" and "ascii," as I'm sure the people who have FTP'ed my shareware and freeware from atari.archive can tell you. As Warwick so aptly put it, you're going to have to twist reality a little bit farther before all "stock" ST's run those demos.

>My platform is not deviant, and all the demos work on my machine. I think
>Dave has a bum ST, and is bitter about it. All this excited yipping about
>some graphics demos should have some of you folks seeking help . . .

I'll make sure I contact my shrink in the morning. (Oops, it already
IS morning! Darn!) In any case, it certainly looks like Mickey the
Atari Demo Cheerleader is back in full force.

My ST is a plain vanilla 1986 model, straight out of the factory. It
has a memory upgrade, but didn't run any demos before I installed the
upgrade either.

If I really were the only one with these "problems," I might wonder about
my ST, but a friend of mine has an eariler ST that exhibits exactly the
same behavior. Others on the net have reported similar phenomena.

I'm hardly "bitter" about not being able to run demos on my ST. I just
think that programs that rely on undocumented hardware tricks are
examples of BAD programming. It doesn't matter how "weird" my machine
is; it's an ST, and it runs all applications JUST FINE. Why can't you
accept the fact that shifter tricks and overscan won't work on all
ST's? Why did anyone every think they would? Atari never said
they would, and the instablility of the screen should have tipped any
experimenters off to extreme bogosity of what they were trying.

>possible relevence between this statement and the new Lost Boys demo, which
>is free, frivolous, incredible, and the subject of the original post.

While you are bowing to the Lost Boys, try to understand that we were
talking about GOOD programming and BAD programming:

Properly written application:

Works on all ST's. GOOD.

Improperly written application that relies on hardware anomalies:

Works on some unclassifiable subset of ST's. BAD.

The people who are really impressed by demos often seem to be those who
don't have a clue what's going on inside their machines. There's a
reason for that.

>Yes, these folks are on an ego trip, program 'badly' perhaps also, but what
>is wrong with that?

J. J., I agree with most of what you said, but you've mis-stated my original claim. I said "programs that rely on undocumnted locations and/or hardware 'features' are examples of 'bad programming'."

I think there's nothing whatsoever wrong with writing demos and releasing them, ego trip or none. I can see the attraction to it. But demos don't have to be shifter-chip dependent to be impressive.

I can think of one very good example. I don't know whose demo it was, but I had the opportunity to see a demo that showed of some 3-D objects created with spheres. One sequence was taken from the "Afterburner" title page. The 3-D effect was very impressive and eye-catching. But why did they then have to ruin it by playing overscan games? It's a frustrating mix of clever programming and wretched programming.

That demo could have been written stricly with software blitting. The assembly language routines would have to be highly optimized to that particular task, but there's nothing wrong with that. Then everyone could run that demo, and without any annoying flicker. Maybe we could even run it from our hard drives -- what a concept!

> To recap , this is not forced upon you to use/view. If it is not your
>cup of tea, simply don't download it. I think it would be highly unfair to
>limit what should and shouldn't be released however.

Well, I'm not going to go around to archive sites deleting files! But nevertheless, I honestly hope that more people will learn to program well and play by the rules. We will all be happier and more productive with software that is robust and works as advertised.

You could also try Canvas, which calls such files *.IMG, but really means
screen dumps (you can, of course, give a different extender in the file
selector when you load the file).

Canvas will soon be appearing on the coverdisk of ST Format here in the UK.
I'm not sure what the intention is, but it may well become PD (since sales
have slowed down a lot, and Microdeal, who publish Canvas, are pressing the
author to do a Canvas II, which he is unlikely to do).

If it does go PD or freeware, you can be sure that it'll get uploaded to a.a.

It is indeed so that the price for the unix includes the hard disk.
However, does anyone know if this disk replaces your internal hard disk,
or if it is an external one including housing and power supply?`
In the first case will they give a refund on the internal disk?

Frans.

PS: Has anyone already *seen* (not -heard of-) a TT or STe with a HD
floppy drive. Of course I only mean official atari versions, not
homebrewn additions.

Hi!

Do anyone know how to start the projecthelp function of PureC without the HELP-key?

My problem is, that I wish to get the definition's position of an object how's name is included in a self made HLP-file.

When starting the projecthelp function in normal way (with pushing the HELP-key) the help function finds the definition's name as a keyword in the HLP-file.

So my question: How to start the project-help directly?

Mailtruk is a program in GFA BASIC with some embedded machine code that
implements UUCP 'g' protocol and does some minimal mail processing. The
author is John Logajan. It's been available for several years. A modified
version of Mailtruk is used as the transport mechanism for Mercury UUCP.

I've seen several articles of this sort recently, and I'm also in the
same boat. My old 1040ST is on its last legs, about ready to give up
the ghost, and I'm seriously interested in replacing it with SOMETHING.
A '386 pc-type machine is a possibility -- and information on those is
readily available -- but I'd also like to consider another ATARI -- and
I've had a much harder time finding info on them.

What I'd like to see (and perhaps others would too) is a list of the
currently available ATARI hardware, along with (relatively) brief
descriptions and approximate price ranges. The descriptions should
include relevant hardware specs and any notable features/mis-features
of the system.

I speak for no-one other than myself --- sometimes, not even that...

THAT is a _very bad idea_... .IMG files are a GEM (both PC, a la Ventura
Publisher and ST) standard format for compressed monochrome bitmaps. If you
have any way of contacting the writer, you should complain.

It's almost like creating a compression utility that uses the .ZOO extender
and some weird varient of LZW compression...

Just my (and probably several other people! <grin>) opinion...

> A million C programming packages!!!! I must have missed 999998 of them.

Right off the top of my head, I can remember 13 of them. Some of the
following are no longer supported:

Alcyon
Haba (Hippo)
Manx (Aztec)
Lattice
Prospero
Turbo (Pure)
Mark Williams
Mark Johnson
SAS
Laser (Megamax)
Sozobon
GCC
Hisoft interpreter

Any not on this list? We're still a *little* bit shy of that magic mill. :-)

Any Atari users out there want to take this off my hands? It's 1 year old and complete with 128K Mac ROMs, all software and documentation. I've got an offer for $250, but I'd like to think it's worth a little more than that (would cost at least $400 new today). Respond be email - houlton@cs.colostate.edu

>1) On a tape or floppy distributed system you only load that which you need,
> which means that you don't waste valuable disk space.

There is nothing to stop you from offloading stuff that you don't actually need or use, to floppy or elsewhere.

>2) What happens if/when you get a head crash, what are you going to boot from?
> How are you going to re-load the system, and what from?

Hopefully some provision has been made for this eventuality.

>Pre-installed drives are all very well for the sealed unit retailers, but what
>about later when the drive breaks!

By that time, one would assume that the sysadmin has figured out how to make a backup. If it is a simple matter to boot partially from a floppy, the full system and everything else can also be restored from backup.

Different system installations have various hardware configurations. Someone with decent tape equipment would have little or no use for distribution floppies. Maybe there should be more options available all the same for distribution media. It should be possible for people to buy what they want, no more and no less.

Good idea--it's really difficult to get an overall picture of all
ST products. Maybe make it part of a FAQ list.

Never said anything different. Why can't you accept the fact that a great
many ST'er enjoy these types of programs? Why can't you understand that
a great many very useful techniques/innovations started out as hacks?

By the way, that is the first ST I have heard of that will run any application
that one could name. Given the quality of some applications out there, that
is a big statement. Now THOSE programs could use a dose of Dave Baggett.

I guess the definition of "application" is the key here? Something like Pagestream? Absolutely. I agree with you 100%. Something like "Ohh Crickey Wot a Scorcher"?!? I think not. The latter is something fun and interesting to some, and happens to be free. I personally do not see the need to berate the creators for not using more conventional programming techinques.

3458. P.D. "Unix" type thingie? Available?

Newsgroup: comp.sys.atari.st
Date: 1991-10-11 23:18:45 UTC
From: bryanw@netcom.COM
Message-ID: <1991Oct11.231845.7540bryanw@netcom.COM>
Source record: 228028

I'm interested in something for my ST that is like Unix in that it has cat, vi, uue, uud etc all in one package, with the ability to run and compile "c" programmes. I have taken a look at gulam, it looks nice, but it is rather incomplete. For instance it does not have vi (something called "ue" which looks interesting) and I don't think it can run c programs.. :(:(

Anyone??

>can you restore your backup. Have you heard of booting Unix from a 720KB floppy???
>

Why, I assume you would do the same as if you had any other normal
Hard drive:
1) Buy new HD to replace damaged HD.
2) Boot up and run formatting software.
3) Load backup onto the new drive.

If you didn't make backups of your UNIX system, then just figure
it wasn't meant to be. :).
You are right however: The Unix system was never intended to run
on anything less than 200MB disks, let alone .8MB floppies. Besides being
interminably slow, you might sprain a wrist trying. Even at 200MB, you are
going to be real tight for space to work with (remember, the system will take
up a good 170 or so- if you are lucky).
BTW, does anyone know if the Atari version implements virtual memory?
One would think that they should as it will be running on a '030, but then
again, since when has Atari reliably done "what they should"? If you get the
200MB drive, I think you will probably have to forget it anyway.

Cross-posted to: misc.forsale.computers,comp.sys.atari.st,or.forsale

First, I'd like to say I have nothing against Mr Fordyce. However, having been taken by the manufacturer of these accelerator boards, I feel I owe it to his potential customers to say the following:

Creative Microsystems Inc. went under because of these boards for a reason. If you install one of these boards in your machine, it may not work properly. I bought one of these for my 1040ST when they first came out. It installed OK, and seemed to work, but it interfered with the operation of the hard disk causing UNDETECTABLE WRITE ERRORS. I only learned this after trashing 3 partitions on my hard disk. It seemed to work OK with floppy disks, but I didn't test it thoroughly. I removed it and sent it back...I never got either a fixed board or my money. I later got another board from CMI's successor, and it too failed to work. I used it for parts.

These boards are not guaranteed to work, and probably will not. Unless you have the means to correct the inherent design flaw, purchase one of the established accelerator boards, and don't risk trashing your machine to save a few bucks.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <48501@cup.portal.com>
Source record: 228162

Martin Boening asked:

>BTW, as of which board revision is upgrading difficult? This important
>tidbit of information was missing from your answer.

I'm afraid I don't know the board revision letter at which Atari
modified the Mega ST2 motherboard to prevent easy upgrading of the
system.. perhaps someone on the net who has the crippled version could
tell us which revision their board is.

The original Mega ST motherboard had all the holes and pc board traces
for all 4 megabytes of memory. For a Mega ST2, only half the memory
chips were actually installed, and during the wave-soldering of the
board, the extra holes got filled in with solder. Upgrading the board
to 4 megabytes was a (relatively) simple matter of unsoldering the
extra holes and installing the remaining 2 megabytes of RAM chips.

At some point, Atari redesigned the Mega ST2 board to eliminate the
holes and traces for the unused memory locations, thus effectively
preventing the easy (and from their point of view, unwanted)
upgrading of the computer into a Mega ST4 for approximately $100.

The only effective way to tell if a Mega ST2 is crippled is to open
it up and check the motherboard. I have no idea at what serial number
they made the modification.

3467. Random Mazes...!

Newsgroup: comp.sys.atari.st
Date: 1991-10-12 09:15:27 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <g96o01w164w@ersys.edmonton.ab.ca>
Source record: 228046

Does anyone know how to generate random mazes, or have a fragment of code they would be willing to post to demonstrate how? I am trying to create random mazes in the fashion of Moria, which have caverns and intersections. Those are just frills that I could add myself once I understand the basic principal, but I'm really confused about the actual generation of a maze. The code that I wrote produced an interesting design, but not a maze. Examples of code can be in C, Pascal, or Modula-2. If you don't have an example, I would be more than happy if you just explained how to do it in english terms. Any help at all with this problem would be greatly appreciated.

On the same note of seeing Atari computers on TV. In a recent documentary of
how some hackers in Germany was getting into some sites in the US, there
were showing them using the Atari 1040ST. I think a book was written about
it.

Atari ships ASV readily installed on harddisk only so you don't have to
install douzens of floppy disks one after another.
Unluckily you have to buy a harddisk with your ASV, but I think, the price
is quite acceptable.
Since harddisks of different sizes cost a different amount of money ...

There's nothing weird about Atari's Unix implementation (at least as far as
harddisks are concerned, I didn't buy my ASV yet :-)

Cheers, Paddy

>J. J., I agree with most of what you said, but you've mis-stated my
>original claim. I said "programs that rely on undocumnted locations
>and/or hardware 'features' are examples of 'bad programming'."

My whole problem with that remark is that you aren't stating that as your
opinion, as it should be. There IS no 'bad' programming if it serves its
purpose. Nothing is bad if it serves it's purpose, right?
Also, what is 'undocumented' locations and/or hardware 'features'?
I admit, most demo programmers aren't [or can't afford to be] licensed
developers so they have no way of knowing what is 'documented' or
'undocumented' in terms of what you can do on the ST. I have nothing
against the 'schooled' approach to computer programming but I think that
being self-taught and approaching problems from a different than what is
taught in schools can be very effective.

>I think there's nothing whatsoever wrong with writing demos and releasing
>them, ego trip or none. I can see the attraction to it. But demos don't
>have to be shifter-chip dependent to be impressive.

No, they don't. Heck, they don't even need to have 512 colors or
animated sprites. But that isn't the point, is it? See? I personally
prefer the added resolution, however. As I said before, shifter-chip
dependant routines will not crash your computer.

>I can think of one very good example. I don't know whose demo it was,
>but I had the opportunity to see a demo that showed of some 3-D objects
>created with spheres. One sequence was taken from the "Afterburner"
>title page. The 3-D effect was very impressive and eye-catching. But
>why did they then have to ruin it by playing overscan games? It's a

Why did they have to ruin it by playing overscan? You don't like the
added resolution? Or did your screen simply screw up due to the overscan?
In that case, the overscanned areas would most likely be blank anyway.
I don't see how you can be saying that.

>frustrating mix of clever programming and wretched programming.

So the clever programming was the spheres and the wretched programming
was the overscan code? Odd. Seems like the programmers would have put
an identical amount of skill into both.

>That demo could have been written stricly with software blitting. The
>assembly language routines would have to be highly optimized to that
>particular task, but there's nothing wrong with that. Then everyone
>could run that demo, and without any annoying flicker. Maybe we could
>even run it from our hard drives -- what a concept!

Like I say and say and say again. Toggling the PAL/NTSC chip will not cause crashes. If the routine is off timing, no overscan graphics will show up anyway!
Personally, I wouldn't want a demo to be loaded off a hard drive. Why? Well, unlike disk drives, there are many many different types of hard drives and controllers. (1) The low-level programming that IS required for demos would eventually conflict with a certain type of drive/controller. [Demo coders rarely have hard drives and it would be difficult for them to write multi-part demos that do animation/sound during loading without knowing what is going on... or cause timing problems with the controller]
(2) Hard drives rarely have write protect switches on them.
(3) Demos aren't useful anyway, so why keep them on the hard drive.
(4) Single part demos CAN run from the hard drive...

>> To recap , this is not forced upon you to use/view. If it is not your
>>cup of tea, simply don't download it. I think it would be highly unfair to
>>limit what should and shouldn't be released however.
>
>Well, I'm not going to go around to archive sites deleting files! But
>nevertheless, I honestly hope that more people will learn to program
>well and play by the rules. We will all be happier and more productive
>with software that is robust and works as advertised.

Sure, like saying my religion is better than yours and there isn't room for two. I own my computer, don't I have the right to write programs any way I want to? Demo coders don't ADVERTISE their software as working and they certainly don't expect their software to be PRODUCTIVE in the way you mean it.

>> The ST is certainly capable of
>>multitasking but any decent low-level implementation of it is
>>going to break some rules.
>I don't see why multitasking is relevant, but I'll address the point
>anyway.
>According to your "fact," MiNT is "not a decent implementation." I
>don't agree.

I think I'll have to take a look at MiNT but if that's what you say, that kind of multitasking waits for the AES event handler to get around to it. Such that pulling down a menu, grabbing an icon, or accessing data off the floppy completely stops other tasks. Won't most software needlessly halt other tasks? Why not pre-emptive prioritized multitasking like on the Amiga? Meaning that no processor time is wasted as a task only takes what is needed! This is the ideal way to multitasking on the ST instead of relying completely on the software to say "okay, back to you Bob!" Like MultiFinder on the Macintosh, you simply cannot rely on software to do the task switching.

>>I find ST demos to be generally more stable than most application
>>software. I have never had an ST demo crash on me.
>This is straight out of fantasy land. You may be able to claim that

And your belief that demo coders should sacrifice overscan just so you'll be able to run their demos. NOT! I honestly NEVER had any bootable demos crash on my ST! My Amiga is another story, however, since my machine doesn't support the PAL mode.

>demos are useful and that exploiting hardware quirks is fun, but you'll
>never be able to make a case for the reliability of ST demos. I can't

Reliability isn't as big a problem as you are trying to portray. I do not believe you at all when you say that you have not been able to get a single one of the demos from atari.archive to work.

>think of a single one that even runs from a hard drive! It's not a

I don't have a hard drive on my ST so I don't know but I don't think you have even tried. I think you are mainly saying that because some of the newer demos use their own format. Try Lost Boys Definitive or any of those other demos that are file based and THEN tell me you haven't found a single one that won't run from the hard drive.

>coincidence that every time a new demo comes out, several people post
>plaintive messages to c.s.a.st asking why it crashes, flickers madly,
>etc.

Yes, that is to be expected when someone spends the time [or even long distance $$$$] to download a 800k file and not have it work. Demos are perhaps the largest files on atari.archive.

>>Well, Tri Engineering could easily add code for faster CPU's.
>
>Yes, to patch their code which doesn't work on all machines. Exactly my
>point. You don't need to "add code for faster CPU's" if you write
>programs properly the first time.

No. You can't simply write a routine 'properly' that updates the palette 3 times each line and have it work on a faster CPU. Spectrum updates the color registers 3 times per scan-line which rules out using a timer or polling the beam position. That would be too slow and inconsistant. Spectrum uses a small piece of code that is timed precisely for the 8MHz 68000 [just look find all those NOP opcodes]. It wouldn't be too difficult to just ask the user what CPU and speed his machine is running on at bootup

[Marx Marvelous steps in]
(or just do a timing loop and try to figure out the screen frequency and processor speed and, given that information, choose an appropriate routine for use on that processor/screen frequency combination -- /\/\ /\/\ of TPPI)

>>>There's nothing inherently nonportable or unreliable about trackers.
>>
>>Like I said, you must not know hardware.
>I've written quite a few digitized sound playing utilities, and none of
>them rely on undocumented techniques. Using the Yamaha chip to play

>The mixing can be achieved either with clever precalculation, or by

>limiting the maximum playback rates. Like I said, if you have to rely
>on CPU speed or hardware bugs to make your program work, you're not
>doing anyone any favors.

Well, tracker routines rely quite a bit more on real-time processing than
simple playback code [which usually just looks up a word value to pass on
to the appropriate soundchip registers].

>The mixing can be achieved either with clever precalculation

Of course!

(MM: which is what we ARE doing when we program trackerplayers.... one
trackerplayer rout i wrote uses a 164 word buffer and mixes all four channels
into the output buffer while the interrupt playback rout is playing
pregenerated sound from another buffer, similar to pageflipping)

>or by limiting the maximum playback rates.

??? Tracker routines play at a consistant rate and rely on 'precalculated'
look up table to scale values. This is obvious. However, speed DOES cause
problems with quality of the sound. [i.e. the NoiseTracker editor in NTSC
mode]. By the way, ever try running on of your sample playback programs
on a TT? Just curious.

(MM: well, actually, now that i think about this, a TT could easily outperform
an ST (even an STe) on playing back trackermusic. So now why should we limit
ourselves to the common denominator of a 68000/8 and ST sound hardware? Also,
the TT is not totally backward compatible anyway, especially with programs
that use any of the vectors down in zero-page because of the extra word on
the exception stack frame.... and thusly the ST OS (ie. 1.3 and earlier) is
bad programming, no? (i am inclined to agree on this account even if the
OS were programmed "responsibly".))

>Bzzt! Thank you for playing -- try again. Sound routines, whether
>digitized or not, are typically run off some kind of interrupt, like
>Timer A. Thus, they play regardless of what the "foreground process"
>is doing. If you can write a sound/music player at all then you get
>asynchronous playing capability for free.
>Animation can be done in the vblank, which is also interrupt-driven.
>No special routines are required to read from disk in either of these
>cases. In fact, writing your own disk routines for this is silly,
>because the OS routines work just fine, and (once again) are guaranteed
>to work on all machines. You also get hard drive support, support for
>removeable media, etc. for free. Why re-invent the wheel?

Bzzz

slow, totally-pre-emptive-of-the-rest-of-the-system wheels?
The guarantee that they work means nothing to me.... they may work, but
do they work the way i want them to? Do they work in such a way that i can
do what i feel i need to do as far as graphics or sound? Why don't YOU
just try writing a replay routine that works while the disk is loading, and
that doesn't totally and utterly skip portions of the sound and/or slow
down and/or produce other undesirable effects?)

>You're right, one can, and in the last few years I've seen some of the
>best assembly language graphics routines written for the ST. (And no,
>I didn't write them!) Assembly language is fine (although not as good
>as a high-level language if you can do what you need in a high-level
>language). I agree with you that writing highly optimized assembly

Until someone writes a compiler with artificial intelligence, C will
never generate code on par with pure assembly code.

>language blitting and scrolling routines is quite an art, and requires
>enormous knowledge and talent. Squeezing more colors or pixels out of
>the shifter chip by exploting undocumented hardware features is neither
>impressive nor correct. It's a failure, not a success. It just puts
>more broken software out there.

I've tested Crikey, Dark Side of Spoon, Aenigmatica, and
Cuddly and on 5 ST's so far and all have ran the demos
fine. Only the first two screens on the Cuddly demo
seemed to have problems on 2 of the machines.
Messing with the ntsc/pal bit for overscan will NOT crash a computer.
It is the interrupt routines most likely cause problems, but of course,
interrupts are 'documented' so that is okay.

---well, I'll stop here for now. This is kind of cutting into our
coding time.. d:^)

Well Nat the conditions under the test was made sound good...BUT for one more time (it must have been said at least 10 times until now in this newsgroup) you have to use the flag 'h' if you wanna get the highest compression from zoo 2.1.....

i.e. zoo21.ttp ah// dir
^
|

If you use the high-compression flag, you'll see that the difference in resulting compressed size between lharc and zoo is insignificant.

Take care now....

> Nat!

>
> Anyone??

I think you need to sort out what you're really looking for. Unix
doesn't have any of those features built in. They're all separate
programs. Everything you mentioned is available for the ST and can be
run from Gulam or any of several other command shells.

There are literally hundreds of Unix-like utilities available on
atari.archive.umich.edu that will run under Gulam or any of the other
command shells for TOS. Among them are free C compilers, uud, uue, at
least two vi clones, text formatters, etc.

I use a very nice alternative desktop called Gemini that includes
among its many features a shell (Mupfel) that can run inside a
window, or take over the screen, depending on your preference. It
also can run character-oriented TOS applications inside a GEM window,
which can be useful (although that feature is unfortunately s-l-o-w.)
Gemini also is available at a.a.

But shell + utilities != Unix. You still don't have a multitasking
system, and you don't have Unix facilities such as pipes.

You can gain multitasking and some other features by adding MiNT or
Micro RTX to your system. MiNT is free. Micro RTX is shareware. To
fully make use of these programs, you need a shell that is aware of
the multitasking package. I think there are a couple of free ones for
MiNT, and Beckemeyer Development Systems sells a Multitasking C Shell
for Micro RTX. You also need to link your C applications with
appropriate libraries (and in the case of RTX you may need to write
rather nonportable code).

But you still don't have Unix.

If Unix is really what you want, you can buy Minix from Prentice-Hall
for around $150. You get a non-AT&T implementation that is very
similar to old Unix Version 7, the last ``small is beautiful'' Unix.
You get a C compiler, a shell, lots of utilities, a multitasking
kernel, and source code to just about everything except the compiler.

But you also abandon GEM, TOS and all applications that require them. Minix will not run standard Atari applications. (For more information about Minix, see the Usenet newsgroup comp.os.minix).

There also is a small, fast Unix-like multitasking system called OS-9 that is available for the ST from Microware Corp. in Des Moines. Like Minix, it cannot run standard Atari programs. It also costs an arm and a leg for the OS-9 C compiler. :-(

So what you need to do is figure out which Unix-like features are important to you, compare that feature list with the characteristics of various TOS shells and utilities, MiNT, RTX, Minix and OS-9, consider how much memory and disk space you have available, and make your choice.

In article <1991Oct11.065903.5474@wam.umd.edu> dmb@wam.umd.edu (David M. Bagge
>J. J., I agree with most of what you said, but you've mis-stated my
>original claim. I said "programs that rely on undocumnted locations
>and/or hardware 'features' are examples of 'bad programming'."

My whole problem with that remark is that you aren't stating that as your
opinion, as it should be. There IS no 'bad' programming if it serves its
purpose. Nothing is bad if it serves it's purpose, right?
Also, what is 'undocumented' locations and/or hardware 'features'?
I admit, most demo programmers aren't [or can't afford to be] licensed
developers so they have no way of knowing what is 'documented' or
'undocumented' in terms of what you can do on the ST. I have nothing
against the 'schooled' approach to computer programming but I think that
being self-taught and approaching problems from a different than what is
taught in schools can be very effective.

>I think there's nothing whatsoever wrong with writing demos and releasing
>them, ego trip or none. I can see the attraction to it. But demos don't
>have to be shifter-chip dependent to be impressive.

No, they don't. Heck, they don't even need to have 512 colors or
animated sprites. But that isn't the point, is it? See? I personally
prefer the added resolution, however. As I said before, shifter-chip
dependant routines will not crash your computer.

>I can think of one very good example. I don't know whose demo it was,
>but I had the opportunity to see a demo that showed of some 3-D objects
>created with spheres. One sequence was taken from the "Afterburner"
>title page. The 3-D effect was very impressive and eye-catching. But
>why did they then have to ruin it by playing overscan games? It's a

Why did they have to ruin it by playing overscan? You don't like the
added resolution? Or did your screen simply screw up due to the overscan?
In that case, the overscanned areas would most likely be blank anyway.
I don't see how you can be saying that.

>frustrating mix of clever programming and wretched programming.

So the clever programming was the spheres and the wretched programming
was the overscan code? Odd. Seems like the programmers would have put
an identical amount of skill into both.

>That demo could have been written stricly with software blitting. The
>assembly language routines would have to be highly optimized to that
>particular task, but there's nothing wrong with that. Then everyone
>could run that demo, and without any annoying flicker. Maybe we could
>even run it from our hard drives -- what a concept!

Like I say and say and say again. Toggling the PAL/NTSC chip will not cause crashes. If the routine is off timing, no overscan graphics will show up anyway!
Personally, I wouldn't want a demo to be loaded off a hard drive. Why? Well, unlike disk drives, there are many many different types of hard drives and controllers. (1) The low-level programming that IS required for demos would eventually conflict with a certain type of drive/controller. [Demo coders rarely have hard drives and it would be difficult for them to write multi-part demos that do animation/sound during loading without knowing what is going on... or cause timing problems with the controller]
(2) Hard drives rarely have write protect switches on them.
(3) Demos aren't useful anyway, so why keep them on the hard drive.
(4) Single part demos CAN run from the hard drive...

>> To recap , this is not forced upon you to use/view. If it is not your
>>cup of tea, simply don't download it. I think it would be highly unfair to
>>limit what should and shouldn't be released however.
>
>Well, I'm not going to go around to archive sites deleting files! But
>nevertheless, I honestly hope that more people will learn to program
>well and play by the rules. We will all be happier and more productive
>with software that is robust and works as advertised.

Sure, like saying my religion is better than yours and there isn't room for two. I own my computer, don't I have the right to write programs any way I want to? Demo coders don't ADVERTISE their software as working and they certainly don't expect their software to be PRODUCTIVE in the way you mean it.

>> The ST is certainly capable of
>>multitasking but any decent low-level implementation of it is
>>going to break some rules.
>I don't see why multitasking is relevant, but I'll address the point
>anyway.
>According to your "fact," MiNT is "not a decent implementation." I
>don't agree.

I think I'll have to take a look at MiNT but if that's what you say, that kind of multitasking waits for the AES event handler to get around to it. Such that pulling down a menu, grabbing an icon, or accessing data off the floppy completely stops other tasks. Won't most software needlessly halt other tasks? Why not pre-emptive prioritized multitasking like on the Amiga? Meaning that no processor time is wasted as a task only takes what is needed! This is the ideal way to multitasking on the ST instead of relying completely on the software to say "okay, back to you Bob!" Like MultiFinder on the Macintosh, you simply cannot rely on software to do the task switching.

>>I find ST demos to be generally more stable than most application
>>software. I have never had an ST demo crash on me.
>This is straight out of fantasy land. You may be able to claim that

And your belief that demo coders should sacrifice overscan just so you'll be able to run their demos. NOT! I honestly NEVER had any bootable demos crash on my ST! My Amiga is another story, however, since my machine doesn't support the PAL mode.

>demos are useful and that exploiting hardware quirks is fun, but you'll
>never be able to make a case for the reliability of ST demos. I can't

Reliability isn't as big a problem as you are trying to portray. I do not believe you at all when you say that you have not been able to get a single one of the demos from atari.archive to work.

>think of a single one that even runs from a hard drive! It's not a

I don't have a hard drive on my ST so I don't know but I don't think you have even tried. I think you are mainly saying that because some of the newer demos use their own format. Try Lost Boys Definitive or any of those other demos that are file based and THEN tell me you haven't found a single one that won't run from the hard drive.

>coincidence that every time a new demo comes out, several people post
>plaintive messages to c.s.a.st asking why it crashes, flickers madly,
>etc.

Yes, that is to be expected when someone spends the time [or even long distance $$$$] to download a 800k file and not have it work. Demos are perhaps the largest files on atari.archive.

>>Well, Tri Engineering could easily add code for faster CPU's.
>
>Yes, to patch their code which doesn't work on all machines. Exactly my
>point. You don't need to "add code for faster CPU's" if you write
>programs properly the first time.

No. You can't simply write a routine 'properly' that updates the palette 3 times each line and have it work on a faster CPU. Spectrum updates the color registers 3 times per scan-line which rules out using a timer or polling the beam position. That would be too slow and inconsistant. Spectrum uses a small piece of code that is timed precisely for the 8MHz 68000 [just look find all those NOP opcodes]. It wouldn't be too difficult to just ask the user what CPU and speed his machine is running on at bootup

[Marx Marvelous steps in]
(or just do a timing loop and try to figure out the screen frequency and processor speed and, given that information, choose an appropriate routine for use on that processor/screen frequency combination -- /\/\ /\/\ of TPPI)

>>>There's nothing inherently nonportable or unreliable about trackers.
>>
>>Like I said, you must not know hardware.
>I've written quite a few digitized sound playing utilities, and none of
>them rely on undocumented techniques. Using the Yamaha chip to play

>The mixing can be achieved either with clever precalculation, or by

>limiting the maximum playback rates. Like I said, if you have to rely
>on CPU speed or hardware bugs to make your program work, you're not
>doing anyone any favors.

Well, tracker routines rely quite a bit more on real-time processing than
simple playback code [which usually just looks up a word value to pass on
to the appropriate soundchip registers].

>The mixing can be achieved either with clever precalculation

Of course!

(MM: which is what we ARE doing when we program trackerplayers.... one
trackerplayer rout i wrote uses a 164 word buffer and mixes all four channels
into the output buffer while the interrupt playback rout is playing
pregenerated sound from another buffer, similar to pageflipping)

>or by limiting the maximum playback rates.

??? Tracker routines play at a consistant rate and rely on 'precalculated'
look up table to scale values. This is obvious. However, speed DOES cause
problems with quality of the sound. [i.e. the NoiseTracker editor in NTSC
mode]. By the way, ever try running on of your sample playback programs
on a TT? Just curious.

(MM: well, actually, now that i think about this, a TT could easily outperform
an ST (even an STe) on playing back trackermusic. So now why should we limit
ourselves to the common denominator of a 68000/8 and ST sound hardware? Also,
the TT is not totally backward compatible anyway, especially with programs
that use any of the vectors down in zero-page because of the extra word on
the exception stack frame.... and thusly the ST OS (ie. 1.3 and earlier) is
bad programming, no? (i am inclined to agree on this account even if the
OS were programmed "responsibly".))

>Bzzt! Thank you for playing -- try again. Sound routines, whether
>digitized or not, are typically run off some kind of interrupt, like
>Timer A. Thus, they play regardless of what the "foreground process"
>is doing. If you can write a sound/music player at all then you get
>asynchronous playing capability for free.
>Animation can be done in the vblank, which is also interrupt-driven.
>No special routines are required to read from disk in either of these
>cases. In fact, writing your own disk routines for this is silly,
>because the OS routines work just fine, and (once again) are guaranteed
>to work on all machines. You also get hard drive support, support for
>removeable media, etc. for free. Why re-invent the wheel?

Bzzz

slow, totally-pre-emptive-of-the-rest-of-the-system wheels?
The guarantee that they work means nothing to me.... they may work, but
do they work the way i want them to? Do they work in such a way that i can
do what i feel i need to do as far as graphics or sound? Why don't YOU
just try writing a replay routine that works while the disk is loading, and
that doesn't totally and utterly skip portions of the sound and/or slow
down and/or produce other undesirable effects?)

>You're right, one can, and in the last few years I've seen some of the
>best assembly language graphics routines written for the ST. (And no,
>I didn't write them!) Assembly language is fine (although not as good
>as a high-level language if you can do what you need in a high-level
>language). I agree with you that writing highly optimized assembly

Until someone writes a compiler with artificial intelligence, C will
never generate code on par with pure assembly code.

>language blitting and scrolling routines is quite an art, and requires
>enormous knowledge and talent. Squeezing more colors or pixels out of
>the shifter chip by exploting undocumented hardware features is neither
>impressive nor correct. It's a failure, not a success. It just puts
>more broken software out there.

I've tested Crikey, Dark Side of Spoon, Aenigmatica, and
Cuddly and on 5 ST's so far and all have ran the demos
fine. Only the first two screens on the Cuddly demo
seemed to have problems on 2 of the machines.
Messing with the ntsc/pal bit for overscan will NOT crash a computer.
It is the interrupt routines most likely cause problems, but of course,
interrupts are 'documented' so that is okay.

---well, I'll stop here for now. This is kind of cutting into our
coding time.. d:^)

>other tasks?

Nope, MiNT doesn't use the AES at all. It is a replacement (essentially) for GEMDOS. It provides pre-emptive multitasking independently of the GEM/AES pseudo-multitasking. And, which I think is the point that Dave was trying to make, it runs on all ST's, TT's, and what have you (there are a few bugs in the TT implementation, but I fully acknowledge that these are *bugs*, and they will be fixed in the next release).

Decent low-level multitasking doesn't have to break *any* rules. Atari has documented lots of interrupts, and even provided convenient hooks into some of them (like the VBI). Use those hooks, and other documented features (like Ptermres, or the various trap vectors) and you can provide multitasking that works on any Atari 680x0 machine, past, present, or (assuming they retain ST compatibility) future.

[on a different note]
>Until someone writes a compiler with artificial intelligence, C will
>never generate code on par with pure assembly code.

This very much depends on the quality of the assembly language programmer. I would say that the state of the art in C compiler optimizers is similar to that of chess programs; the very best humans are still better than the programs, but the programs are better than most humans. (Yes, I know that the demo programmers *do* spend the time to squeeze every last cycle out of their code; but most assembly language programmers do not, and many overlook even relatively simple things like putting the addresses of frequently called functions into registers that good C compilers will do. So a blanket statement like

that is really quite misleading.) (And finally: someone wrote a brute force optimizer that simply tries every possible combination of instructions and picks the one that performs a function in the least number of cycles. This isn't practical (yet) for a C compiler, but it does guarantee the absolute best possible code, and it doesn't require artificial intelligence).

Hi , I am presently looking for a compiled version of gnuucp on ATARI
I have the source code in my possesion but not the C compiler neede to
compile it .
So if anybody here happens to have that on their hard drive I would really
appreciate if they could send me a copy of it to
madmat@frmug.fr.mugnet.org
by the way if someone would be gentle enough to send me mercury I would
appreciate it just as much.

Thanks in advance and keep on programming.

3480. Keyboard recommendations

Newsgroup: comp.sys.atari.st
Date: 1991-10-13 13:47:22 UTC
From: allenmj@gdlvm7.vnet.ibm.com
Message-ID: <9110131352.AA10781@ucbvax.Berkeley.EDU>
Source record: 228050

My wife is interested to learning to play the piano. I'd like to buy a Midi compatible keyboard and hook it up to my Atari. What would be a good keyboard for the beginner (name/model, functions, cost)? Are there any programs for the Atari that teach you to play the piano? Something that can display sheet music on the screen and tell if you've played it correctly. I'm also interested in programs (PD to start) that would let me program/play the keyboard from the ST. I don't know anything about Midi or keyboards, so I'd also like a reference to a book or magazine to get me started.

Thanks,
MikeAllen allenmj@gdlvm7.vnet.ibm.com

From: sytang@lamar.colostate.edu
Message-ID: <18415@ccncsu.ColoState.EDU>
Source record: 228153

Looking back the old magazine and found Supra's old AD about their 10FD drive, (the 10MB floppy). It said the drive can read 360KB and 1.2 MB IBM floppy disks too. Is there any ST user with Supra FD-10 has try that? Does it reads IBM floppy disks? If so, how does it access the floppy? (i.e. does it read the disk simply when one double click the drive icon, or needs to go through a program? afterall the floppy disk has different FAT and structure from the hard drive).
Thank you
Tang
sytang@lamar.colostate.edu
P.S. On the related note, Has any one use Insite's I325VM with ST yet? ICD said their software has support in it too.

3483. Re: P.D. "Unix" type thingie? Available

>rather incomplete. For instance it does not have vi (something called "ue"
>which looks interesting) and I don't think it can run c programs.. :(:(

I think, you misunderstood some things :-)
First of all `Unix' is a real mighty multi-user- multi-tasking
operating system. What you wanna have, is a unix-like CLI (Command
Line Interpreter). But you have to know, that no Unix-CLI has the
features you talk off. The CLI acts as a translator, who takes
commands from the user and traslates them to the computer. In fact,
if you type `vi' on your console, the shell (CLI) looks for as
program called `vi'. What I want to tell you is, all commands, like
`vi', `uue', `uud', ..., are separate programs. With this knowledge,
you see that `gulam' is as complete, as any other CLI, taht is
available for the ST. Along with a CLI, you need all of these
utilities. Look at the archive servers for packets called
`unixtools', ore something like that.

And another thing. No CLI can run c programs! You must compile any c
source text to get an executable program. This task is done by a
compiler. Freely available c compilers are e.g. GNU-C or Sozobon C.
If none of them fits your requests, you have to buy an appropriate
compiler.

>
>Until someone writes a compiler with artificial intelligence, C will
>never generate code on par with pure assembly code.
>

Mmmm. I don't know. I once knew this guy, that always told me:

"If you have to resort to assembly language, you don't understand the
problem."

I have found that to be very true in most cases today, as hardware
is pretty cheap per MIP. Plus, compilers are really getting good
at compiling.

Personally I think we could work both ends of the stick if we had
better education in this country about software design in general.

I attend school at this University and the software design
curricula is absolutely horrendous. 4th year seniors still
don't know what the hell "source debugger" means, or even know
how to correctly externalize and organize thier data structures.

If we could make better programmers, I don't think there would be
such a great demand for optimizing compilers.

I would also like to point out, that assembly language skills,
are OK, to a point but:

1) If you over do it, your putting a lot of effort into a machine
architecture that will soon be obsolete, and if you really over
do it, YOU will be obsolete TOO.

2) Nobody, or Corporation can afford to hire obsolete people, guru
days of machine level programmers are gone.

3) Nobody wants to buy obsolete software written by obsolete people.
People want, they have the right to demand:

a) Software that runs on all platforms (If your a UNIX vendor).
b) Software that runs consistently from machine to machine.
(Unless your in the USSR, where some instructions don't
always work on all machine models..WHAT A NIGHTMARE).
c) Software with a reasonable price.
d) Software that is easy to use.

You can't do either one, or both with the techniques employed by
writing these "hot" demo's for the ST.

Which is were we overstepped the line in our discussion. Because
everyone has to get their jobs done. And everbody wants to play,
or be entertained.

I hope its clear that these are two very different paradigms people use
to make the software for either play or work..

>>language blitting and scrolling routines is quite an art, and requires
>>enormous knowledge and talent. Squeezing more colors or pixels out of
>>the shifter chip by exploting undocumented hardware features is neither
>>impressive nor correct. It's a failure, not a success. It just puts
>>more broken software out there.

Mmm, I have never known any area in computer science, that requires
more talent than writing and designing compiler/language tools.

If you want to see enourmous genius, take a look at BORLANDS compiler's,
its rumored the central engine scanner/code generator is PORTABLE,
accross any machine platform! The performance is outstanding.

Let alone the environment that comes with it!

As for your comments about hardware, and sqeezing colors and pixels,
actually I would thinnk that would be quite straightforward, hardware
display capabilities are always a limit and very determinable factor.

Its pretty straightforward what hardware can and cannot do.

So I think I disagree with part of that statement.

>of Tibetan Peach Pie Inc., DEMO CODERS.

I think, people we have gotten off track a bit about this topic of
do's and don't about good programming practices.

The ORIGINAL thread, was meant to point out that DEMO's use coding
and design practices that are not very productive in the real world.

Now we are arguing about the relative merits about doing DEMO's
in the first place.

I love DEMO's, but everything has its place. I do believe however,
that DEMO or NO DEMO, if it can't run on all machines, its not a
very good DEMO. Or at least I am not too impressed.
(Personal Opinion, everbody knows Gregory has lots of OPNIONS.)

Or should I say, I am DEPRESSED that the manufacturer I buy the machine
from is such a COMPLETE IDIOT as to undermine the software communities
ability to write consistent programs for its machine..

Hardware manufacturer here is left up to the person reading this to
figure out...

|[...] I was wondering whether
|the accompanying unix utilities, uwtool, uwplot, uwterm, and
|uwtitle work with the ST implimentation of UW. [...]

Those facilities came along in the later Mac versions that support the extended UW protocols (I believe there are currently two extensions). Since the ST implementation was based on the original protocol and no development effort has been put in to evolve it (at least by us), these features are not supported.

You can use select the rename operation (or alt-R) to retitle the window. Alt-T is a synonym for "hide top".

3486. Demos and what is important (was Re: Crikey)

Newsgroup: comp.sys.atari.st
Date: 1991-10-13 17:42:27 UTC
From: chu@acsu.buffalo.edu
Message-ID: <1991Oct13.174227.2161@acsu.buffalo.edu>
Source record: 228158

I just wanted to mention that the "implicit assumptions" of the two sides of the argument seem to be different. One side seems to say, "These techniques allows to do really impressive things!" and the other side seems to say, "But they don't work on all STs!"

I hope I'm not giving away any big secret by saying that these two facts are not contradictory. It's just this mini-flamefest could go on forever if that's all the two sides say to each other. It seems fairly clear that one side really doesn't care if they release programs that may not perform as expected on all STs, whereas to the other side, uniform performance from released programs is quite important.

(Note the use of the word "released".)

It seems that if there are any further discussion on this topic, it should take this into account.

>sounds quite familiar to me. I think you have one big switch for all
>machines, right? Well, the hard drives need some time to spin up. This time

Sorry to disappoint you, but I actually have 3 switches:

atari
supra i/f and drive
micropolis drive

It's quite primitive and some day I'll just have get one main switch...

>The solution is to switch on everything except your Atari, wait approx. 30

Since it actually don't matter how long I wait before powering up the atari
I'd suspect that the problem is as som kind soul mentioned that the
micropolis drive needs a physical reset signal which the atari don't send
until I do a reset after power up. The only sollution as I see it is to
buy/get/copy/steal a new micropolis ROM...

It detects this difference and is working as it should be.

Please note, though, that it cannot write 360, 720 and 1.2 floppies so it is
of limited usability.

I thought my atari 1040STe was the best until I started reading this
news group.
After see how pathetic it was I decided to jam a few more megs in.
I took off the cover and ripped out one of the sims, took it down to the
local computer store
and ask for some 1 meg simms. Noooo problem except the simms they had
the 41256-12 9037 chips but
did not include the four caps and the two 513256AJ-100 8927 mystery chips.

Does It matter?

I thought simms were simms why are theses chips different?

Can I really upgrade my machine to 4 megs?

And now for something completely different.
Whenever I turn my machine on with a disk in the drive, the mouse
directions are reversed.

Is this some sort of messed up desktop info?

Many Thanks

Recenly I have had an odd keyboard occurence on my 1040 ST. First the m and
n keys would not work, so I rebooted, they came back. Then I lost the x,z and
v keys. They simply would not 'click' or print. I treid a number of bootup
disk, same thing. I then gave the st a 'little' drop (the savious of so many
problems. Everything worked again. Could it be a loose connecting somewhere
? Are the xz,v keys on one line somewhere and the same with the m,n ones?
Anyone who has any ideas on this please let me know,as this was a tad bit scary

3493. Seeking Recommendations ST Mouse & Hard Disk utils

Newsgroup: comp.sys.atari.st
Date: 1991-10-14 05:26:29 UTC
From: daw@locus.com
Message-ID: <1991Oct14.052629.2511840@locus.com>
Source record: 228172

Hi, I'm sure this has been talked about before so bear with me.

My Mega 2 ST mouse is real crappy, awfull feel. I've heard there are some
cheap (50 $) mouse replacements that feel like nice (like a Mac mouse).

I'm also seeking recommendations on a hard disk file checker. I have
an 85 mega Supra but I don't think thats important. I'm looking for disk utils
that'll just read sectors and update the back track table.

Any recommendations on mice and hard disk utils???

Thanks

Or you need to meet a hard time constraint, or you need it to run a bit faster, or you have to access some hardware at a very low level, or you wish to use a resource in a non-predetermined way from the OS's point of view, or . . .

>
>I have found that to be very true in most cases today, as hardware

>at compiling.

Good yes, even great, but to truly get the most optimal code programmers often resort to at least some assembly. This can often be done with a few lines of inline assembly in the right places, which can be rather difficult to find :-). Also, our software and our problems have a funny way of expanding to fill available resources as fast as they are technologically extended.

>Personally I think we could work both ends of the stick if we had
>better education in this country about software design in general.

I agree, but this does not always mean "high level programming is better". High and low level programming both have their pros and cons, which I won't bother to point out since they are part of every school's Comp Sci curricula.

>
>I attend school at this University and the software design

Sorry, but optimizing compilers are here to stay, for a number of very
good reasons. Also, the field of code optimization study will be
marketable for the forseeable future (I damn well hope so!).

>

As a famous ST programmer once said, "Assembly language = job security"
(Dave Small). You are correct if you are talking about a totally obsolete
chip set, but
a) most chip set instruction sets scale up to a large degree,
without many suprises, and
b) if you can become an expert on even an obselete chip set, you
should have the smarts needed to figure out a newer one.

>
>2) Nobody, or Corporation can afford to hire obsolete people, guru

> c) Software with a reasonable price.
> d) Software that is easy to use.

Fortunetely this list is presently impossible to achieve consistantly, which
is why we are still making bucks (and not digging ditches, like all those
telephone switchmen). Platforms change out from under you, subtle bugs in
your code kill you, subtle bugs in the compiler kill you, subtle bugs in the
OS kill you, etc etc. Also, "nobody" is a pretty broad term.

>
>You can't do either one, or both with the techniques employed by
>writing these "hot" demo's for the ST.

Some of these demos took a lot of work. Lots of very clever programming, and
making the machine do things it was not supposed to be able to do. There is
still PLENTY of room for such innovative programmers.

>
>Which is were we overstepped the line in our discussion. Because
>everyone has to get their jobs done. And everbody wants to play,

>or be entertained.
>
>I hope its clear that these are two very different paradigms people use
>to make the software for either play or work..

I think it might more accurately split between "generic portable coding" and "maximum optimized coding". For example, if you wished to process some very mathmatically intensive problem on some machine, and you manage to find some weird little hack which speeds it up for your machine, you could probably care less if it runs on anything else. On the other hand, if you are trying to produce a word processor, you would be very concerned about portability and conformation to manufacturer standards. There is quite a bit of grey area in between, which many demos fall into. The programmers want as many STers possible to be able to enjoy their work, but if it bombs on some STs . . . If I could produce a demo that could display 16 million colors on the screen without flicker, but it would only run on 70-80% of the ST's out there, I would do still it (given that my machine was one of them!) because it would still be a really neat hack (and hopefully 70-80% of the users would agree with me :-).

>

Alright! Nice to hear some recognition for my chosen area of research.

>
>If you want to see enourmous genius, take a look at BORLANDS compiler's,
>its rumored the central engine scanner/code generator is PORTABLE,
>accross any machine platform! The performance is outstanding.

Strange how this thread has actually twisted into my thesis project?!? I am currently working on a debugging tool for such a "portable" compiler. Because of this, I am familiar with Borland's work. It is true that the scanner/optimizer is machine independent. This is achieved by translating the source code (in whatever language the compiler is for) into a machine independent secondary language, then optimizing it. Knowledge of the specific machine being compiled for is in the form of a "machine description", which is actually a grammar that describes legal assembly for that machine. It is consulted a bit during optimization (for example, to get the number of registers), but for the most part the optimizer works machine independently. After the optimizer is done, the secondary language (often called RTLs for "register transfer list", by the way) is naively converted into either native assembly or object code. If the former, a peephole optimizer can be applied to look for opimizations introduced by the code generator. Assembly is the final step (again for the former).

My point for this little spiel (other than showing off :-) is that there is still quite a bit of very low level skill needed to produce the machine description and code generator. Also, some machines benifit from a few very special optimizations, which can be added to the machine independent optimizer only for that machine. And, I can tell you from hard won experience that working on compilers requires a very in-depth knowledge of assembly in general, and whatever processor(s) you are working with in particular.

>Let alone the environment that comes with it!
>
>As for your comments about hardware, and sqeezing colors and pixels,
>actually I would thinnk that would be quite straightforward, hardware
>display capabilities are always a limit and very determinable factor.

The point here is that some of the demos go beyond the limits thought possible by Atari (who did build the damn thing). That is what is so cool!

>
>Its pretty straightforward what hardware can and cannot do.

The thing which attracts and fascinates me about some of these demos is the way some of these programmers have managed to make the ST hardware do things it was never designed to do. I am reminded again of Dave Small, who states that everybody (Apple, Atari, Byte Magazine, etc) insisted that there was no way an ST could emulate a Mac very well. They all feel a bit dumber now . . Another interesting thing which crops up is accomplishing something in software which everyone thought you needed additional hardware for. This "pushing the envelope" (another Smallism, by the way) type stuff is what keeps me downloading demos.

>
>So I think I disagree with part of that statement.

Jeez, we left the tracks some time ago :-). However, this has been a rather interesting thread. I even got to announce to the world what I have been crouched in my office doing for the last year :-).

>
>The ORIGINAL thread, was meant to point out that DEMO's use coding
>and design practices that are not very productive in the real world.

Ah, a very real (and very high paying) part of the "real world" is snapping up good assembly hackers as fast as they can find them. Deep in the bowels of AT&T, Borland, Microsoft (actually, Bill Gates is such a guy, so "bowels" might be aiming a bit low) etc there are such folks. A touch of irony is realized by the fact that their achivements enable high level programing to yield decent runtime performance. Compiler folks are notoriously "low level", which is why compiler output has gotten dramatically better in the last 10 years.

There is a bit of a chicken-and-egg type logic here. First, one must learn to program in high level languages, and unlearn evil gotos and unstructured approaches. If one gets really good at it, one realizes that to get optimal performance one must descend to a lower level, where tightly structured highly modular code is much harder to produce (and may not be the best way to go about it anyway). A full circle is made. It is amazing how my coding style has changed from my undergraduate "high-levelness" to my current work. Having a good understanding of how compilers work has changed my programming forever (and for the better). My awareness of the low-level wizardry needed to enable the majority of programmers to work in high-level environments makes me even more impressed by some of the stuff I have seen in various ST demos.

By the way, yesterday's "neat hacks" become todays "operating system features". The industry is not stupid. One good example is the Twister format (damn, I can't get rid of Dave Small). Some of the earlier ST drives could not handle any kind of extended formats. However, since they have become so popular, Atari now supports them (and even supplies such formats from their new desktop, I believe). If overscan really took off, Atari would alter their design specs to ensure it would work on future ST's, and perhaps even extend TOS to be able to use canned overscan routines. My point here is that this is progress, not just piddling around.

>

Oh no, not OPNIONS! That sounds really painful . . . . :-)

>
>Or should I say, I am DEPRESSED that the manufacturer I buy the machine
>from is such a COMPLETE IDIOT as to undermine the software communities
>ability to write consistent programs for its machine..
>

Yeah, me too. Then again, I seem to have much more fun with my ST than the various PC's and unix boxes I work with and manage. I am also able to produce great results in the "biggies" (word processing, DTP, telecommunications), so I guess I can't bitch too much. I just wish Atari could get their

advertising shit together and let more people know just how neat an ST can be. Of course, if they did manage to do this and became a huge computer giant, they would probably start doing an IBMish big brother act.

All the above is IMHO. Direct flames elsewhere (feel free to praise compiler folks though :-).

>you have even tried.

Oh yeah, I just go around making things up and posting them to worldwide networks. Right. Of course I've tried running them from my hard drive! Talk about the pot calling the kettle black -- you don't have a hard drive and you're telling me * I * haven't tried running things from hard drive?! Please, get your head out the sand.

>I think you are mainly saying that because some
>of the newer demos use their own format.

I'm saying that because the things don't run from hard drive.

> [Marx Marvelous steps in]

Amazing that the two of you combined still can't figure out what you're trying to argue against. In my previous response I tried to explain in great detail what I meant, and you're still handing me the same rhetoric.

> By the way, ever try running on of your sample playback programs
>on a TT? Just curious.

Why yes. In fact, every sample playing program I've ever released for the ST works on the TT. And HacMan II works just dandy on a TT. (Right, Warwick? :) Have you even downloaded anything I've written? In short, have you thought about the fact that trying to damage someone's credibilty when you know nothing about them or what they've written is really stupid?

>Bzzz

I won't even ask what you mean by "case in point: twister." Almost all my disks are twister formatted and TOS reads them * JUST FINE *.

> Why don't YOU
>just try writing a replay routine that works while the disk is loading, and
>that doesn't totally and utterly skip portions of the sound and/or slow
>down and/or produce other undesirable effects?)

I have, otherwise I wouldn't have made the claims I made. Warwick has too, and his program works * JUST FINE ON A TT *. If you'd ever downloaded anything written by any of us, you'd know that. But I guess you're content to live in your own little hacky fantasy world. You think that any time you can't get something to work it can't be done. Get a grip on reality and realise you and your little team of programmers aren't the best in the world.

>I've tested Crikey, Dark Side of Spoon, Aenigmatica, and
>Cuddly and on 5 ST's so far and all have ran the demos
>fine.

Sorry, but you can't prove things by example. You can only disprove things by example. (Which I've already done in this case, so don't bother.)

>psteffn@gnu.ai.mit.edu (Paul Steffen, aka STratoHACKster)
>with comments by,
>jpickar@caticsuf.csufresno.edu (Jon Pickard, aka Marx Marvelous)
>of Tibetan Peach Pie Inc., DEMO CODERS.

Get your facts straight and then talk. (BTW, you can have the last word. I'm not going to bother with this pointless debate any more.)

3496. Pulldown Menus

Newsgroup: comp.sys.atari.st
Date: 1991-10-14 06:36:56 UTC
From: raycole@matt.ksu.ksu.edu
Message-ID: <kfieo8INN2do@matt.ksu.ksu.edu>
Source record: 228173

Does anyone have or know of a program to give the ST pulldown menu's like the mac that works with MACCEL3? I have tried pulldown.acc by Joachim Honig but since it plays with the mouse also it conflicts with maccel. It`s not really a big thing, mostly cosmetic, but I've gotten used to pulldown menus instead of dropdown menu's. Any help would be appreciated.

Yes.

>2) I have gulam, 5 Megs of TeX files from terminator, and a big mess.

Don't use the mess from terminator. Use the CS-TeX port by Christoph Strunk,
available for ftp at ftp.thp.uni-koeln.de and other ST servers.

This TeX comes with an installation program that does EVERYthing for you:
unpacking the files, making the directories, installing the formats,
generating the fonts, it's all automatic !!

3499. REFBASE program for scientific references available

Newsgroup: comp.sys.atari.st
Date: 1991-10-14 11:11:07 UTC
From: ate@cs.ruu.nl
Message-ID: <1991Oct14.111107.19268@cs.ruu.nl>
Source record: 228170

REFBASE
is a database program for scientific references, written by Jan de Boer.

From the introduction:

REF_BASE is a card box program for entering, storing, searching and
printing scientific references. REF_BASE is designed to handle titles
from publications which have appeared in journals. For the
administration of book-titles the record layout is probably somewhat
less suitable.

REF_BASE will only run in high resolution screen mode (640 x 400
pixels). It is advised to install a screen accellerator such as
Turbo ST; this will significantly speed up scrolling through the
records.

REF_BASE was developed on a Mega ST4 with TOS 1.4. The program was
briefly tested on an Atari TT and seems to function without problems
on this machine. Although REF_BASE will run on an ST with 1 Mb of
memory and a single sided floppy disk drive, it is advised to use an
ST with at least 2 Mb of RAM and a harddisk.

Assuming an average size of 400 characters per reference, a 1 Mb ST
will load only about 800 references, whereas a 4 Mb machine has enough
space for about 6000 references. If a file becomes too large for
the memory of the computer, it can be split up into two or more
smaller files, which can still be 'chain searched' by REF_BASE in a
single run.

REFBASE is available via anonymous ftp from archive.cs.ruu.nl

---
We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'REFBASE' via anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
File: ATARI-ST/misc/refbase.zoo
Don't forget to set binary mode!

--> How to get 'REFBASE' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.
** PLEASE USE VALID DOMAIN ADDRESSES. DO NOT USE ADDRESSES **
** WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET **

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!hp4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/misc/refbase.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

3500. Re: Crikey

Newsgroup: comp.sys.atari.st
Date: 1991-10-14 12:12:19 UTC
From: stefan@spc.nl
Message-ID: <1991Oct14.121219.23478@spc.nl>
Source record: 228175

Err... I have been reading a heated discussion about the yes and nos of
demo programming, some people think it is OK, and some people think it
is bad, relying on undocumented features of the hardware, unportable code
etc.
I have been programming the ST a lot, a lot of low-level code, and I have
contributed bits and bobs to demos like Mind Bomb and Ooh Crikey.
I think some people are missing the point here.
What we do it program for fun, program because we like to excercise our
skills, to improve them. Also, there is a close 'scene' of demo programmers
that like to show off to each other, and we think it is nice for other people
to see what their machine can do.
The fact that we use hardware tricks is something people will have to live with.
Even the nice, ANSI C application programmer that writes applications that will
work on a thousand machines will have to accept this. We write our stuff the
way we like, we use the hardware to its fullest extend. Also, we actually
test it on other machines (believe it or not). Crikey was finished in the summer
of '91 and it worked on all machines we tested it on, Swedish, German, English,
Dutch, old, new, Mega, whatever. Now there are machines out there that don't
work with our demos, well, errr... too bad. A lot of people DO like them,
and that is what we wrote them for. Also, do not forget the fact that they are
free, it didn't cost you anything.
Also, the demos have never been designed to be downloaded from bulletin boards
or whatever. I mean they have to be cracked first, and if the person that does
this screws up, things don't work and they blame us. Get a disk instead, one
that was properly copied.
We worked for about a year on Crikey, using pretty clever code if you ask me
(all modesty aside for a moment) and we released it so other people could enjoy
it too. We never thought about 'playing by the rules', what rules?

>
>Any recommendations on mice and hard disk utils???
>
>Thanks
>

Well, you might want to try a trackball (try one before you buy one, some people hate them). I have tried almost all of the mice out there, and they all seem to have one standard problem, when you move the mouse at any speed above a crawl (at least, what I consider a crawl, many people swear they never move their mouse anywhere close to as fast as I do), the mouse cursor on the screen jumps around in circles, but does not go in the direction you want it to. This drives me crazy, so I never bought one of the replacement mice (the worst is the "golden image" mouse, I can't get the damn cursor to move anywhere, even when moving the mouse at speeds I consider to be ultra-slow). I eventually bought a trackball that I am fairly happy with, the one with the thumb activated ball and finger buttons (sounds weird, but works well for me).

Oh, a tip for trackball owners: When I first got mine, I had a hard time controlling it, especially after long hours of use. It turns out that the shiny ball was too slick to properly drive the rollers, and got even worse when oil from my hands built up on it. Eventually the mouse would barely move. So, at one point I popped out the trackball itself, and took nice fine steel wool, and went over the whole surface with it until it was a nice matte finish, instead of shiny. This worked great, I have far superior traction with my fingers to the ball (it is almost "grippy"), and have had absolutely no control problems since.

Also, I put a bunch of those little rubber feet (you know, the kind you buy at Radio-shack, about 1/2" squares, the kind you have to put under your Mega if you want to be able to get disks in and out without moving the keyboard every damn time) under the trackball, and just kept adding them until I got it up to a level equal to the back of my keyboard. This way I can rest my hand on the upper right side of the keyboard while using the trackball - very Ergonomic?

well, let me end my ramblings, hope this helps someone out there...

>Anyone upgraded their SC with it??

Well, the SC is very usable (used to have one, but did not need it after awhile). Anyways, I used to do classwork with TurboC and Smalltalk/V on the SC, and it seemed to work really well. Of course you are stuck with the 1 meg inside it (ways to get around that). There is a program at msdos.archive that lets you use some of the extra RAM above 640k as extended memory (I can't think of the name off hand) but this definitely speeds things up (like with TurboC, less dis accessing since some of the previously loaded LIB files stay in RAM). If you can get a good deal on it, I'd say try it out - Like you said - it's not a speed demon, but it does the trick. As for the 286 expansion, plan on spending at least an extra $200 or so...

Dave Baggett said what the real problem is, but didn't EMPHASIZE IT!
Demos run on an UNPREDICTABLE subset of machines. The only way you
can tell whether a demo will run is to try it on your machine - very
disappointing if it doesn't work, even if the demo is free. Nobody
objects if you say that your demo only runs on TTs or on STEs or on
double sided floppy machines, but when you pound the hardware to the
point where any one of a lot of incompatibilities could throw you off,
the program just isn't worth it except as a curiosity. BTW, machines
that don't synch up to 50Hz make most demos unviewable, and it IS
possible to use timers and things legally so that NoiseTrackers can
work in Mono - relying on the vertical blank for timing is a bogosity
really. That said, I definitely fault Atari for keeping the
"legalities" of programming STs so well hidden.

Yes you can really upgrade to 4 meg. Just go to someone who supports
the mac and tell them you want FOUR 1 meg SIMM modules (I'd get 80ns ones)
for your Mac (don't admit that you have an ST, they'll claim that they
don't know what you're talking about!) and pop them in. Or you can do what
I did; call Microprocessors Unlimited, and tell them the same story; i.e.
you need FOUR 1megX8 SIMMs 80 nanosecond speed, for your MAC.

Microprocessors Unlimited has an ad in each issue of Computer Shopper.
They have competitive prices and , IMHO, the best service.

3509. Downloading to ST disk's using MTools on a SPARC.

Newsgroup: comp.sys.atari.st
Date: 1991-10-14 17:02:12 UTC
From: adm2@doc.ic.ac.uk
Message-ID: <1991Oct14.170212.29150@doc.ic.ac.uk>
Source record: 228194
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi Netters,
WE've just got some new SPARC IPX stations here,and I've been trying to download ST software from it to a ST or PC disk using SPARC-MTOOLS,which is a program for operating the sparc's floppy as a PC disk.But sadly it doesn't seem to work.So for instance when downloading a text file,you only get the first page or so repeated an infinite number of times,rather than the complete file.

Has anyone ever successfully downloaded ST software on a SPARC???

Has anyone even tried????

All possible replys would be appreciated.....

Alan.

(lots of stuff deleted).

From your post, it looks like you tried all the tricks I know (you may have seen my earlier posting on these problems). Anyway, the problem is almost surely the fact that the disks were formatted in an HD drive. In fact, ne matter what drive the disk if formatted in, if files are written to in with a HD drive, the GCR can't read them well. Most manufacturers are using HD drives to write thier 800K disks now, and this causes problems even with purchased software (system 7 disks have this problem, but that does not much matter at this point). Gadgets is aware of the problem, but has no solution at this point (the mac HD drives just write the disks enough differently to really screw the GCR up). Find a mac with the standard drive, and re-write all your disks there and then try them. If you GCR can format a disk itself (as you said above somewhere), then the problem *should* be the HD written disks. I even re-copy all my original software disks that I get written on HD drives at the company, this way I don't have to go back to another computer if my backups go bad and I have to re-install the software.

> I have recently bought a Quantum LPS105S (105 meg, 20msec, 1130kb/sec)
> and daisychained it to my existing ICD host adapter and Seagate ST177N.

Well, I have one of those and an ICD host adapter and it works fine.
I have a couple of thoughts:

- bad SCSI cable try another one or swap the drive with the Seagate
and see what happens.

- terminating resisters. Never have figured out what they are for.
From what I've heard, whether you need them or not is determined
by a random number generator when the drive is made. I had to remove
mine.

- bad connection on the drive id jumpers.

- bad power supply connection

But, hey, I'm just guessing the obvious. I doubt this is much help.

In article <9110131352.AA10781@ucbvax.Berkeley.EDU> allenmj@gdlvm7.vnet.ibm.com ("Michael Allen") writes:
~>My wife is interested to learning to play the piano. I'd like to buy a
~>Midi compatible keyboard and hook it up to my Atari. What would be a good
~>keyboard for the beginner (name/model, functions, cost)?

What's right for your wife will depend on her goal; if her primary interest is learning to play, I would suggest you look for a keyboard with full-size, velocity-sensitive keys. I purchased the Yamaha YPR-20 digital piano - it only plays 5 sounds and has no rhythm, but it does have a reasonable MIDI implementation, and has good keys. Cost me just under $300. I also purchased a Yamaha PSS-790, which has mid-sized non-velocity-sensitive keys, but has great sounds (100 or so), incredible rhythm and accompaniment (best I've heard for under $1200), and a full MIDI implementation, all for $260. Therefore, I use the YPR-20 for playing, and the PSS-790 for great sounds, rhythm, or sequencing via the Atari. The combined cost of $560 is much less than an equivalent full-sized keyboard with comparable sounds and rhythms, though Yamaha does now have a keyboard with velocity-sensitivity and OK (not great) sound and rhythm for $350 or so.

~>Are there any
~>programs for the Atari that teach you to play the piano? Something that
~>can display sheet music on the screen and tell if you've played it
correctly.

I've seen some packages at B&C Computervision in Santa Clara that do claim to be educational, but I'm not sure how far they go. It didn't look like a complete "learn to play" package, more of a helper for certain styles and chords once you've got a background in playing. The package I've seen for Nintendo looks like what you are looking for, but I've not seen it for the ST.

~>I'm also interested in programs (PD to start) that would let me program/play
~>the keyboard from the ST. I don't know anything about Midi or keyboards,
~>so I'd also like a reference to a book or magazine to get me started.

There are two programs I'd suggest you download (both are shareware). The first is MMM, for Midi Music Maker. It will play virtually any music file for any platform (Atari ST, 8-bit, C64, Amiga, IBM) through your speaker or your MIDI keyboard. Second is Alchemie Jr, which is a very full-featured, though not simple, sequencer. It may be somewhat daunting at first due to it's complexity, so you may want to download a simpler sequencer first to gain familiarity with the concept.

~>Thanks,
~>MikeAllen allenmj@gdlvm7.vnet.ibm.com

You're welcome.

Source record: 228193

What you are describing could be caused if either your original disk-drive still has it's terminator fitted, and/or your new drive isn't terminated.

The new drive could work fine on other systems, even unterminated, as long as where they were tested was relitively free of RF interference.

I hope this is helpful.

Steve

Well, as for availability, I can rattle off one good mail order place I
have used. It is Computer Garden, 1-800-456-5689. As for mice, there are
many choices. Atari redesigned their mouse, and it is much nicer than the `
earlier models. Also there are a bunch of third party mice. One really
neat one is the beetle mouse (which looks a bit like an art-deco beetle).
Anyway, call around and see what's out there. Current Notes recently did
a review of various mice for the ST, and found them all to be acceptable
(and fairly similar). You want to stay away from huge DPI values, as this
will make the mouse track too fast (better to stick with a standard value
and accelerate in software). There is also a cordless mouse out there,
using an infared thingy.

What is a back track table? There are several good hard disk utilities
out there. If you own a hard disk with an ICD host adaptor (it should
say at bootup if you do), you can use Cleanup (it may work with all
host adaptors, I am not sure). Michtron released a package called
Turbo Hard Drive kit, which includes a defragger, consistancy checker, and
some cache utilities. Let me know if this is what you wanted (I could have
misunderstood your question).

From: n160ao@tamuts.tamu.edu
Message-ID: <4811@tamsun.TAMU.EDU>
Source record: 227969

I am about 90% done installing TeX. Could some one send me the "tex.setup"
file mentioned in the last "Welcome to comp.sys.atari.st" article?

Or could someone simply tell me:

1) Their TeX directory structure, what files are where

and

2) The setup information for

gulam, or
bash, or
MiNT/ksh

I simply was to start using TeX 3.1 that I downloaded from the atari archive.
I will happily post to Atari Archive a "So, this is your first time to install
TeX on the Atari" manual as soon as I get it set up myself.

Thanks.

>
[stuff deleted]

Hi Howard,

Sorry, but I don't see any relation betwen the above problem and KR2ANSI...
on the other hand, i may have misunderstood your message. If I understand
correctly, you say that K&R function declerations promote every character
parameter to an integer (which IMHO is a compiler-dependant situation).

But even if this is the case, how does it affect the usage of KR2ANSI ?

Suppose the following situation:

A K&R style source file called, say "test.c", contains among other funs
the function:

```
int foo(bar, baz) /* BTW, your programming style is not supported */
char bar; /* by KR2ANSI (the character '{' must be the 1st */
int baz; /* word on a line)...but you have the source code */
{ /* for kr2ansi */
...
}
```

Now using KR2ANSI and output redirection, you can generate a file, say "test.ans" which will contain

```
extern ...
...
extern foo(char, int);/* or extern foo(char bar, int baz);(see kr2ansi.1) */
...
```

Now you can go back to "test.c" and add a new line:
#include "test.ans"

and compile it with an ANSI compiler, thus gaining parameter-checking...

IMHO this works no matter what an old-style C compiler does with the parameters of the functions...am I wrong?

If I'm missing something please let me know.....

From: dcrevier@jarthur.claremont.edu
Message-ID: <1991Oct14.235458.29718@muddcs.claremont.edu>
Source record: 228198

I recently got an SLM804 and Ultrascript, and I have been using it
to (among other things) print stuff from the macintosh. I would like to use
either true type or adobe type manager, but Ultrascript doesn't seem to like
files created by either. When printing something created with ATM it
complains about an illegal font format or something, and when trying to use
something produced with True type, it gets an illegal setmatrix command.
Has anyone else had any luck getting either of these programs working with
a ultrascript?

thanks

Dan

This list has been working now for quite a while, but everything has
been pretty quiet.

So now officially:

I have put up a mailing-list for serious Atari-users.
It is quite parallel to comp.sys.atari.st, but more expert-oriented
and only for certain group of people; developers, hardware-wizards,
hobby-importers, moderators, user-clubs etc. = really serious users.

The address of the list is: ataripu@otax.hut.fi

Requests & stuff concerning the list: jartsu@otax.hut.fi

Things concerning Atari, not especially the list: jartsu@nic.funet.fi
(I am one of the Atari pd-area moderators at nic)

The list has been up for several months now, and it has about 50
members now, majority is TT-users.

Especially I would like to have more German members to the list, since
their own group in news dnet.atari is not so widely distributed.

Comments, flames etc. accepted with gratitude, but preferred to be
public ones. Emailed comments are not woth it...
-> So post your opinions & suggestions to these newsgroups or
to the list.

Concerning the list, I am also an unofficial contact to the Finnish
ST-user club.

3527. Atari ST software for sale

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 01:10:40 UTC
From: kimmel@umvlsi.ecs.umass.edu
Message-ID: <1991Oct15.011040.5992@risky.ecs.umass.edu>
Source record: 227951
Cross-posted to: misc.forsale.computers,comp.sys.atari.st,ne.forsale

I'm selling the following Atari ST software:

Personal Pascal v2.0 $15

Philon FAST/Basic-M $20
An elaborate BASIC compiler which
claims to be MS-BASIC compatible.

MT C-shell $15
Unixlike multitasking, multiuser
(supports modems as dialups) environment.

All of the above come with the original documentation. Prices do not include shipping. All prices are negotiable, and I'll also trade for old Infocom games. Please e-mail me if interested.

Your symptoms sound like a virus I've heard about.

The clincher is that it only happens when boot with a disk in the drive. This is typical of a boot sector virus. You now need to run a virus eradicator.

Good luck, and don't forget to check ALL your disks.

P.S. An ounce of prevention etc, etc; always boot from the same disk, leave it write-protected, and check any new disks your friends might give you.

> "test.ans" which will contain
>
> extern ...
> ...
> extern foo(char, int);/* or extern foo(char bar, int baz);(see kr2ansi.1) */
> ...

The problem is that the correct prototype (according to the ANSI
rules) for the example above is:

extern foo(int, int);

Why? Because of the old-style declaration; because the function was
declared in the K&R style, parameters must be promoted like K&R says,
i.e. char->int, float->double, etc.

I wrote a program called "mkptypes" that should be floating around
various archive sites that does this; given the input:

...
/* A K&R type declaration */
int foo1(bar, baz) char bar; int baz; { ... }

/* an ANSI declaration */
int foo2(char bar, int baz) { ... }
...

It produces the output:

#ifdef __STDC__
#define P_(x) x
#else
```

```
#define P_(x) ()
#endif
...
extern int foo1 P_((int bar, int baz));
extern int foo2 P_((char bar, char baz));
...
#undef P_
```

i.e. it promotes parameters automatically, and it protects the prototype headers by a macro so that they can also be used by non-ANSI compilers (of course, this can be turned off, and the output style can be changed). Plus, it doesn't care where on the line the '{' character is :-).

You may want to try mkptypes out if you liked kr2ansi.

Regards,
Eric

- 1 -

>>I do not believe you at all when you say that you have not been
>>able to get a single one of the demos from atari.archive to work.

- 2 -

>>I don't have a hard drive on my ST so I don't know but I don't think
>>you have even tried.

>Oh yeah, I just go around making things up and posting them to worldwide
>networks. Right. Of course I've tried running them from my hard
>drive! Talk about the pot calling the kettle black -- you don't have
>a hard drive and you're telling me * I * haven't tried running things
>from hard drive?! Please, get your head out the sand.

And you said that > I < was getting personal. Well, to keep this from
becoming a flame war, let me re-state what I mean. Append the words
'boot off floppy.' at the end of sentence 1 and 'hard enough.' to
sentence two and you'll see what I originally meant. No hypocrisy
involved here.

>>I think you are mainly saying that because some
>>of the newer demos use their own format.

>I'm saying that because the things don't run from hard drive.

I assume that you have tried every demo every written for the ST
to come up with that assumption. See above.

>> [Marx Marvelous steps in]

>Amazing that the two of you combined still can't figure out what you're
>trying to argue against. In my previous response I tried to explain in
>great detail what I meant, and you're still handing me the same rhetoric.

I'm sorry if we confused you. I believe we understand this disagreement
entirely. I can write code that is just as system-independant as anybody.
As I said to John Chu in e-mail, I personally feel that the only difference
between the two approaches is that the demo coders involves himself in the
hardware much more and in turn, takes more risks. If the demo coder has
no difficulty in writing compatible code because it just means taking less
risks.
I think a good analogy is a Classical and a Jazz performer. It's generally
much easier for a Jazz musician to cross over into the strict world of
Classical performance than it is for a Classical performer to cross-over
into freeform Jazz. While Jazz can be very schooled, you don't learn rules
set by others because there simply AREN'T any rules. The more a Jazz

musician breaks from tradition [i.e. takes more risks], the less he/she may be understood, the less he/she will be appreciated, and less people will buy his/her records. However, the people who do understand the music are more and more devoted. Trends are started this way.
What relation does this have to computers? Well, think of the Jazz musician as a computer programmer who writes his code, completely uninhibited of compatibility with other platforms [i.e. commercial success] but the platforms that DO run his code, run it increasingly well [i.e. devoted fans] and may start a trend. [as they have in Europe]

I don't know if it was your remark about how people who appreciate demos are the ones who don't understand what goes on inside a computer but I find that one of the most ridiculous and illogical remarks I have seen on this subject. Why? Because generally people who have no clue on what goes on inside their machine will usually get bored by a demo in a matter of milliseconds [What? Why isn't the joystick doing anything? Isn't this a game!?!?!?]. The primary reason I like demos is because I enjoy trying to guess what the algorithm or hardware quirks that the programmer took advantage of. Other people may like the demos because they are great for showing off hardware in front of Mac's and Amiga's.

>> By the way, ever try running on of your sample playback programs
>>on a TT? Just curious.

>Why yes. In fact, every sample playing program I've ever released for
>the ST works on the TT. And HacMan II works just dandy on a TT.
>(Right, Warwick? :) Have you even downloaded anything I've written? In
>short, have you thought about the fact that trying to damage someone's
>credibilty when you know nothing about them or what they've written is
>really stupid?

Okay, I am perhaps the only person in the whole networld who isn't familiar with your God-li-ness. My intention of this argument is to argue programmer to programmer but, I guess, since I am a lowly assembly programmer of 7 years [since 12 years of age] and you are a world-known software developer, my opinion is insignificant and any criticism from me is an uncalled for attack. After all, it was a simple question I asked..

>>Bzzz

Be kind to Marx, he's probably half your age. I personally believe he
is quite correct [I'm pretty much the Amiga coder of the group] in what
he is saying. Nobody can ever know for sure if they are right or wrong
but I think Marx has a pretty good idea. If you disagree, please state
so instead of irrelevant attacks. By the way, Marx spent quite a bit
of time looking at disassembled TOS code.

>I won't even ask what you mean by "case in point: twister." Almost all
>my disks are twister formatted and TOS reads them * JUST FINE *.

I do believe that he is talking about Twister format built into TOS. Everybod
pretty much knows that TOS is flexible enough to read twister format and
11 sector/track disks but his point is that it may take someone out of Atari
to find a better way of doing something. Even to the point of Atari deciding
to include it as part of the operating system... [Which should have been
done with KAOS!!]

>> Why don't YOU
>>just try writing a replay routine that works while the disk is loading, and
>>that doesn't totally and utterly skip portions of the sound and/or slow
>>down and/or produce other undesirable effects?)

>I have, otherwise I wouldn't have made the claims I made. Warwick has
>too, and his program works * JUST FINE ON A TT *. If you'd ever
>downloaded anything written by any of us, you'd know that. But I guess
>you're content to live in your own little hacky fantasy world. You
>think that any time you can't get something to work it can't be done.
>Get a grip on reality and realise you and your little team of
>programmers aren't the best in the world.

I'll just type something while my subconcious tries to sort out any
logic in that previous paragraph. I, myself, wrote a continous
sound playback/record program several years back that worked relatively
well at 8KHz using TOS routines on a Twister formatted disk.
I used two 80k buffers [as I wanted to give the user enough time to
switch disks for multi-disk continous samples] but every once in a
while, the head would move back and forth. While this rarely caused
skipping, it was an undesirable effect [particularly on the tracks
nearing the end]. Marx's DMA disk routines could probably do 15KHz
without any problem, particularly if a circular method were used where
only side one is written from tracks 0-79 then side two going backwards
79-0. Little wasted head movement. Something impossible to do using TOS.

>>I've tested Crikey, Dark Side of Spoon, Aenigmatica, and
>>Cuddly and on 5 ST's so far and all have ran the demos
>>fine.

>Sorry, but you can't prove things by example. You can only disprove
>things by example. (Which I've already done in this case, so don't
>bother.)

So, I am wrong and you are right?

>Get your facts straight and then talk. (BTW, you can have the last
>word. I'm not going to bother with this pointless debate any more.)

Well, you attack Marx and I irrelevantly to the discussion and then walk away. Do I sense defeat? I have nothing against a discussion if the two people are open-minded [which I believe I have been more than you] and if the discussion may be even remotely informative to other people. This is not a flame-war and I think we both have made good points so far. However, I am only talking about a style of programming that you simply cannot accept while I have already said that I accept yours.

3534. Re: Downloading to ST disk's using MTools on a SPARC.

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 09:00:40 UTC
From: huber@skye.gmd.de
Message-ID: <5909@gmdzi.gmd.de>
Source record: 227967
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MTOOLS on a SPARC - Station with SUN OS 4.1.1 did not work for me, but you
can do the following:

format an MSDOS compatible floppy (DD) on the SUN:

fdformat -Ld

mount the floppy drive as a PC file system:

fdmount

use the filesystem on the floppy as if it was a UNIX file system
(with the well known restrictions on file names):

cp *.txt /pcfs

(the floppy filesystem is called /pcfs)

unmount the filesystem after work is done:

fdumount

go to your Atari and simply use the disk as if it were an ST one.

If you want conversion between UNIX and Atari text format, use dos2unix
and unix2dos programs on the SUN.

Hope this helps. Hans

Source record: 227961

(lacking quoting ability....)

dmb@wam.umd.edu (Dave Baggett) talks about Twister's ability to be read by the normal standard TOS.

However: I'd like to challenge you, using only versions of TOS 1986 or earlier, to write a Twister formatter WITHOUT resorting to using the DMA hardware directly. (Bit of a challenge, no?)

Unless i'm totally mistaking your idea of "good" programming, this isn't something that's very possible now is it?

Personally, i'd say we should all chip in and buy you a new set of custom chips for your ST so that you could actually run these demos without anything bombing or not working. (And by custom chips i mean standard Atari issue GLUE, DMA, MMU, and Shifter...)

And all this talk has got me started thinking.... maybe, just MAYbe, i'll write a terminate-and-stay-resident ProTracker player that slows your machine down fourfold but still gives you great sound while you're wordprocessing, manipulating files (yes! Even while disk DMA runs! Be shocked!), or even playing an accompanying tune out the MIDI port on your bank of DX7's.

Now, the point of that is that most applications can be made system friendly (e.g. Spreadpoint's Cube-O-Matic demo for the Amiga), but some, like overscan and supercolor, though hardware-friendly (perhaps overscan isn't such a good example of this, i'm not certain...), are not OS-friendly. And i think this is the OS' fault.

It all boils down to portability versus performance (as someone said earlier), and we all have different positions on this continuum.

>However: I'd like to challenge you, using only versions of TOS 1986 or earlier,
>to write a Twister formatter WITHOUT resorting to using the DMA hardware
>directly. (Bit of a challenge, no?)

Although David Small had to address the floppy drive routines (through
intercepts of valid TOS calls, mind you) in order to FORMAT in Twister mode,
no such routines are necessary to READ a Twister-formatted disk. The fact that
one could read a Twister-formatted disk on a stock 520/1040ST disk drive
implies 'good programming technique' on the part of Mr. SMall.

The fact that several European hackers could format 82-track disks, while not
all stock 520/140ST disk drives could read 82-tracks, implies 'bad' programming
technique'.

What is the difference? The former provided benefits to everyone owning an ST,
while the latter provided benefits to the few people who happened to have disk
drives which could perform better than the specifications.

It would be suicide for COMMERCIAL software to provide benefits only to those
few people whose machines exceed the specifications!

That's why 'demo programs' can only be demo programs, and are not commercially
viable (in the sense that people wouldn't pay good money for half-assed, or no,
performance on their machines).

> And all this talk has got me started thinking.... maybe, just MAYbe, i'll

Fine. Just don't expect me to be impressed if it

a) doesn't work on my Mega 4 ST

b) doesn't work with my CZ 230S synthesizer.

> It all boils down to portability versus performance (as someone said earlier),
> and we all have different positions on this continuum.

Indeed. And the reason demo programs are only 'demo programs' is that they
don't perform well on all platforms. They are not truly 'portable'.

3539. Atari 1040 STe MIDI setup for sale or trade (for 386)

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 14:42:27 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <10624@vela.acs.oakland.edu>
Source record: 227972
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.wanted,misc.forsale.computers,mi.wanted,ne.wanted,ba.forsale,chi.forsale,na.forsale,ne.forsale

I have the following for sale:

NEW Atari 1040 STe (1 Meg, DSDD internal, stereo sound, TOS 1.4)

just traded my old 520 ST in for it, and found out that
I can no longer use Flight Simulator on it

Computer includes the following:

SF354 SSDD external floppy drive, PS and cables

NAP analog (orange on black) monitor and cables

Hayes 2400 Bps Personal modem

Two Joysticks and a mouse

Software includes the following:

Master Trax Pro and 2 MIDI cables cables (CPU has in and out)
Michtron Super Conductor Sequencer
Ultra MIDI Music Workstation from MIDI Mouse Music Software

DBMan V database III+ compatible database

LDW Power Spreadsheet (VP planner compatible Spreadsheet
with graphical support)

GSTC C compiler

Liesure Suit Larry I The land of the lounge lizards
Liesure Suit Larry II Looking for love in several wronge places
Police Quest II The Vengeance

Lots of PD Software including Sozobon C, Uniterm 2.0e,
Gulam, Nethack, Moria, and lots of utilities/ham radio programs.

Books that I have for it inlude:

Computes Atari ST programmers Guide
Abacus:
2 Atari ST Internals
3 Atari ST GEM Programmers Reference
4 Atari ST Machine Language
5 Atari ST Tricks & Tips
6 Atari ST Graphics & Sound
10 Atari ST Introduction to MIDI Programming

11 Atari ST BASIC to C
12 Atari ST 3D Graphics (with disk)
6502 Assembly language programming (for xfrmr software)

I will include a nice little computer stand, most of the original packaging materials, as well as 50 + disks. The reason that I am selling it all, is because I am looking to get an IBM or an Amiga, or at least perhaps a Stacy so that I can use the ST portably. Might be getting a 386 machine since I want to run Fsim IV, so I would be interested in offers for trades.

I am interested in any and all offers, will try to get rid of the whole shot if possible as a set, but will keep offers for partials. I will also include with the package, Flight Simulator II for the older ST's (if you have a use for it) and the Prodigy Software that came with the Modem for PC's. Please be sure to include whether your offer includes shipping or not. Thanks, and hope to do business with you soon...

3540. lasers n things

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 16:10:35 UTC
From: M19701@mwvm.mitre.org
Message-ID: <91288.43835.M19701@mwvm.mitre.org>
Source record: 227975

The other day I asked several misc questions about several different things. One of those was whether or not to buy a laser printer. Well, after a quick tally of the votes (more to convince my wife then me) we proceeded back to "Price Club" to get LP. Needless to say at $350/LP they had sold out. I talk to department manager about getting a "rain check" and he laughed. Price Club sold 12 units at $349 due to a "computer" error when actual selling price should have been $799. (Something about wrong line being typed in). Anyway, to the people that said to get it thanks and if I ever see a deal like that one again, I buy first and ask opinions later. sigh . . . 12 units at a loss of $450 each . . . . sigh . . . if I'd only known . . . I'd've bought 3. . .

thanks . . . . ed.

3541. How do MOD files get played?

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 16:19:12 UTC
From: gpinzone@GEORGE.POLY.EDU
Message-ID: <9110151619.AA13299@george.poly.edu>
Source record: 227971

I noticed all this talk about .MOD files going on, and I'd like to know how the ST plays these files.

I know that the ST's sound chip only has 3 voices, but MOD files have 4 sampled voices. Furthermore, the ST (I think) uses all three to play a sampled sound, like a SPL file, as an example.

I am under the belief that these MOD players emulate Amiga chips to do this. How true is this?

Finally, has anyone tried playing a MOD file with a Tweety Board installed? I heard sampled sounds/music was awful and I'd like to know if there is any true seperation with this board.

Any news on any stereo upgrades for the ST? Any home brew ones? :-)

If the tweety board works with 3 out of the 4 voices, I wonder if it is possible that a board could be made to "find" the remaining one.

3542. "I need SIMMs for my Mac"

Newsgroup: comp.sys.atari.st
Date: 1991-10-15 16:55:22 UTC
From: kbad@atari.UUCP
Message-ID: <3105@atari.UUCP>
Source record: 227981

I nearly fell off my chair laughing when I read:

england@milton.u.washington.edu (Gregory Miller) writes:

>Just go to someone who supports
>the mac and tell them you want FOUR 1 meg SIMM modules (I'd get 80ns ones)
>for your Mac (don't admit that you have an ST, they'll claim that they
>don't know what you're talking about!) and pop them in. Or you can do what
>I did; call Microprocessors Unlimited, and tell them the same story; i.e.
>you need FOUR 1megX8 SIMMs 80 nanosecond speed, for your MAC.

Why wouldn't you just tell them the truth? Are you so ashamed of
owning an Atari computer? Why not just tell 'em: "I need four 1 meg by
8 Mac-type (as opposed to PC-type) SIMMs, 80 nanoseconds or better, for
my Atari computer"?

Gee, and if you wanted to be helpful to your fellow Atari owners, you
might even go so far as to let said chip supplier know that if they get
any other Atari owners looking for SIMMs to upgrade their STe's, this
is the type of SIMMs that the chip supplier should sell 'em.

Do you really expect to get looks of leprous contempt when you say the
word "Atari" at a place where you might buy SIMMs? You shouldn't. You
might get a surprised look as the uninformed chip merchant wonders why
you'd need SIMMs for your video game. On the other hand, if it's a
smart chip merchant, they might be wondering if they were missing a
chance to sell more SIMMs to Atari computer owners.

Why do people give the kind of advice quoted above? Maybe there's a
clue to the tone and nature of Miller's advice in his signature...

From: jartsu@nic.funet.fi
Message-ID: <JARTSU.91Oct15201640@nic.funet.fi>
Source record: 227973
Cross-posted to: comp.sys.atari.st,comp.music,rec.music.makers,rec.music.synth,dnet.atari

I would like to use two MIDI-software packages under Steinberg's MROS.
Problem is that both these have the protection key that requires to be
inserted in the ROM-port.

So now I am looking for a switcher-module that can hold 2-3 moduls. I
know these exist, but I have never seen one and don't know where to
look for one.

So if you know a source and a price for one, please Reply.
I would prefer a construction-kit (cause they are less expensive), but
ready-made ones if they are reasonable-priced will do too.

If I remember correctly, there is a Swiss firm making this kind of a
kit?

Since this is cross-posted to so many groups, I would appreciate if
you use Email instead of Followup.

> RETURN in '92

No !, No !, You Don't need the 6 Chip Version at all, the 2 chip version fits in place of the 6 chip version.

There are some solder pads to change and a IC to remove, it is all in the suplied doc's that come with the chip set..

Note: some machines that have a 2 chip Rom Set, don't have all there sockets, so its a little hard to fix a 6 chip set..

>Hi , I am presently looking for a compiled version of gnuucp on ATARI
>I have the source code in my possesion but not the C compiler neede to
>compile it .

I'm looking for that stuff too. When I looked through the sources, I
saw that the ST-bindings are written for MWC with MICRO-RTX. I got
the sources to go through GCC, but they failed when linking. I don't
know too much about C, so I went on to other projects.
It would be pretty nice, if anybody could port that stuff to go
through GCC with MinT, it's not as hard, because GCC compiles most
of the sources without any changes.
I still have to use the UUCICO by Jan Willamowius, which is written
under GFA and bombs if it's started under MinT.

Bye...Michael

>I heard sampled sounds/music was awful and I'd like to know if there is
>any true seperation with this board.

The Tweety Board sounds HORRIBLE with most types of samples.
The left and right audio outs on the STe also sound horrible with some
programs, but with others (especially those designed for it [surprise,
surprise]) it sounds superb.

>Any news on any stereo upgrades for the ST? Any home brew ones? :-)

There is a stereo card out called the "Master Stereo Cartridge" I
believe that is supported by MPH's TCB Tracker program.

3552. hard drive/memory/TOS upgrading?

Newsgroup: comp.sys.atari.st
Date: 1991-10-16 07:15:54 UTC
From: doucetdb@vax1.mankato.msus.edu
Message-ID: <1991Oct16.011555.909@vax1.mankato.msus.edu>
Source record: 227983

I have an Atari 1040 ST color system with 1 meg of RAM, and just the internal 720K floppy that came with it. I have had it for just over 3 years, and although I am fed up with the support of the machines in the US, I would still like to upgrade it a bit.

1) I want a hard drive!

2) I would like 4 megs of ram.

Does anybody have any info on prices/places for this stuff? I would be willing to spend about $500 bucks for a drive, whatever that will get me, I don't know. And, is there anything I should know about the ram? Such as problems that can occur, and how to install it, etc? Also, I have TOS version 1.0, I think. Any recommendations on upgrading that? What would it do for me, and what problems might it cause? Are there any public domain programs (or commercial) that upgrade the TOS through software? And lastly, this is a different question all together, but does anybody know what happened to STart magazine? I have been too lazy to call them, but I should have about 2 years left on my subscription, since they went bi-monthly, but the last issue I got, was about 4 months ago?!? What's up with them?

Thanks in advance...

>Your symptoms sound like a virus I've heard about.

Ah! Its the #?*%$! ghost virus again! This is (apparently) the most common ST virus. If memory serves me right (it rarely does :-), this isn't actually a "maliciou"s one (ie. it doesn't do any real damage), just very annoying.

>The clincher is that it only happens when boot with a disk in the drive. This
>is typical of a boot sector virus. You now need to run a virus eradicator.
>
>Good luck, and don't forget to check ALL your disks.

More importantly, check any _new_ disk; that way you can keep tabs on what's coming into your collection.

>P.S. An ounce of prevention etc, etc; always boot from the same disk, leave
>it write-protected, and check any new disks your friends might give you.

Exactly. My brother (the one who wrote Canvas) picked up the ghost virus from someone (we don't know who :-( ) who sent him a disk for an updated version.

Paranoia rules!

Joao,

the ST Club, 2 Broadway, NOTTINGHAM NG1 1PS publish a very good GDOS font editor called FONTKIT PLUS. There is a manual, and an explanation of metafonts. The Club also publish a newsletter which has been running a short series on metafiles and their contents. The club's P.D. library also have material that may interst you including fonts of (varying) quality.

Their phone number is 0602-410241 (+44 602 410241 from outside the U.K.). You will find them helpful, but they do not accept payment by credit card. I suspect that they can help you with the Bubble Jet problem, or will know who can.

>no such routines are necessary to READ a Twister-formatted disk. The fact that
>one could read a Twister-formatted disk on a stock 520/1040ST disk drive
>implies 'good programming technique' on the part of Mr. SMall.

Address the floppy drive routines?!!!!!!

Oh really now. Last i checked the only way to send a format track command
to the FDC was through the DMA system or through flopfmt(), and flopfmt()
definitely does NOT support track skewing. and isn't the DMA system
something undocumented anyway? (I'm not about to shell out $350 for half
of what i can get in _ST Internals_ for under $20, especially just for a
fact to prove a point, when there's probably hundreds of registered
developers on the net who'd be willing to answer, no?)

Also, it wasn't "good" programming technique, even by your definition...
doesn't this take advantage of a certain bug/feature in the hardware?
Namely, that the sector directly after the index pulse does not have to
be numbered 1?

And now what's going to happen, now that Western Digital isn't making
WD1772's anymore? Will this hardware bug/feature still be present?
(Or am i many months behind on this WD news? If nothing else this net
thing is drawing me out of my hermithood. =:^))

>The fact that several European hackers could format 82-track disks, while not
>all stock 520/140ST disk drives could read 82-tracks, implies 'bad' programming
>technique'.

Hrm. Well, now maybe we should all point the finger at Atari for setting its
sights too low =;^)

>It would be suicide for COMMERCIAL software to provide benefits only to those
>few people whose machines exceed the specifications!

>That's why 'demo programs' can only be demo programs, and are not commercially
>viable (in the sense that people wouldn't pay good money for half-assed, or no,
>performance on their machines).

You get what you pay for... it's that simple. Demo software isn't commercial software. Frankly, i don't care to be paid for demo programming. It's sharing a little peace of love (pun intended) with someone else. Sharing art..... well-adjusted televisions A through H can view my demo... if television J can't, then take it in and get it adjusted, if you want to see my demo, or otherwise, don't view it. But don't bitch at me.

In commercial-type software i would consider it prudent, if not _de rigueur_, to include some sort of a switch so that those of us who can use a hardware trick can, and those of you who can't, don't. And if i choose not to include such a switch in my demo, then Just Change The Channel (tm).

>> manipulating files (yes! Even while disk DMA runs! Be shocked!), or even
>> playing an accompanying tune out the MIDI port on your bank of DX7's.

>Fine. Just don't expect me to be impressed if it

>a) doesn't work on my Mega 4 ST

If not, blame Atari.... your Mega4 isn't 100% back compatible with the ST. So why should i even try? =:^)

Or maybe i'll utilize the blitter, just to make you that much more impressed. (Now how do you access the blitter through BIOS/XBIOS? Someone email me and enlighten me so i can last until i borrow a friend's STe for the weekend.)

>b) doesn't work with my CZ 230S synthesizer.

Blame Casio for their inept implementation of MIDI, not me. (by the way, i have no knowledge whatsoever of how complete, or how lacking, Casio's MIDI implementation is.)

>> It all boils down to portability versus performance (as someone said earlier),
>> and we all have different positions on this continuum.

>Indeed. And the reason demo programs are only 'demo programs' is that they
>don't perform well on all platforms. They are not truly 'portable'.

For the most part, demos DO perform well. If you want to look at it as, say, 320x200x16 being official Atari spec, all demos _should_ conform to this spec, elsewise the video hardware just plain isn't durable enough (although it is this same non-durability that gives us overscan and 512 colors.)

Now 400x512x512, while not Atari spec, is something that most of the rest of us may readily enjoy. We've seen Atari change software designs to accomodate innovations (such as.... Twister, for example...)... now why not hardware as well?

(Maybe because the coders aren't releasing their overscan code? hmmmm...)

In conclusion, i've two things to say to the general net.populace:

1) Had Dave Small been the first to use overscan, you'd be oohing and ahhing over it to this day. (of course, it probably would have been a little bit more reliable as well, but still...)

2) maybe i'll start writing my articles like drieux and see whether i don't suddenly get considered a complete eccentric with rather good ideas. =:^)

Oh, by the way, thank you for your followup. It's nice to be able to learn things, no?

> He uses AHDI 1.7.
> Is there any known problem with this configuration ?

Perhaps using AHDI 3.01 (don't use 3.00 it is buggy and destructive)
will solve the problem, you don't have to reformat
but if is whise to do so (after making a backup ofcourse).

Other possibility: you didn't ship the HD before moving and ruined it.

Third possibility: Your friend's STE (1040?) has the DMA hardware problem
and he never found out about it because he didn't had a
HD?

Fourth possibility: ????

Don't know about US prices, but it seems a bit tight to me.
>
> (B) I'm interested in DTP, word processing, and programming.
> Naturally, I don't mind a few (or more than a few) games, but this is
> not my primary reason for looking at the ST.

DTP -> minimum MegaSTE 2 with standard HD(50Mb), preferable TT or MegaSTE 4 but probable out of price range
+ programming -> maybe bigger HD if you want to use TEX for DTP and GNU for programming (cheap since both are PD/Shareware).
TEX takes 10 Mb, GNU about 5Mb add 5Mb for bootsoftware (acc's and auto's), 10 Mb for utilitys and 5Mb for games 5Mb free room to shuffle leaving 10Mb for your files which will be filled in about 3 months

If you want to do DTP you might had a bigscreen if you have the money since this can only be done with the TT and MegaSTE it rules out the 1040 STE with extra RAM. Two megabyte is a must for DTP and GNU/TEX, four is prevered. If speed is a critical issue you should save up for a TT otherwhise a MegaSTE will do. If you want to add a 19 inch screen later on the TT saves you a graphic card extension (unless you want 24bit color).

Conclusions: - MegaSTE2 with 100MB drive instead of standard 50Mb still setup will last about 2 years
- MegaSTE4 with 100Mb drive if you can affort the extra dollars
- TT if you want easy expension in the futher in that case you can add memory if you need it
add bigscreen cheaply
add large SCSI drives (standard SCSI port)
step over to UNIX if you want

Hope this will help

> 1. Is it better to upgrade to a newer machine or update 1040ST?
I think you can get more for almost the same money if you update to
MegaSTE or 1040STE

> 2. If I upgrade, which machine is recommended and why? I'd like to keep
> as much hardware and software compatibility as possible.

1040 STE only updates you video and sound hardware and TOS version
it is better prepared for VCR editing and has a standard TV modulater.
memory is easly added.

MegaSTE same hardware updates as 1040 plus:
- internal SCSI drive
- even newer TOS version (much nicer desktop, bit like Neodesk/Gemini)
- faster (68000 at 16Mhz)
- second serial port

TT same video and sound hardware as STE models plus
- internal SCSI drive + external SCSI port added
- same functional TOS version as MegaSTE
- extra serial ports
- standard LAN port
- VME bus
- 68030 at 32Mhz
- probably to much machine for you, if you find MacIIci to much for at home

I probably left out some things, look at your local Atari dealer for complete
specifications

> 3. If I update 1040ST, what updates exist and are they worth doing to a 5-
> year old machine? (It ain't broke so don't fix it mentality) Again,

hardly worth your money.

> 4. If I upgrade, is there Networking software available so the kids can use
> the 1040ST while I use newer machine or another 1040ST?
Yes, but don't know if it works OK

> 5. Will the Packard Bell (PB9815) Laser Printer (LP) work w/ ATARI computers?
> My local price club has them for $350 (yes, $350). Tech sheet says it
Perhaps it will work

> 6. Since old faithful is only a 9-pin dot matrix, my wife and kids are getting
> on my case about getting a new printer anyway. Would a 24-pin dot matrix
> be a better buy or the above laser (if its ATARI compatible)?

Look at the HP deskjet (or other inkjet printers) it is much cheaper than
any laser printer and has almost the same quality. Even if you buy the cheap
laser printer you still have to pay for the toner every XXXX prints

Yes, TCB Tracker does indeed support the Monster STEreo Cartridge. I won (oops! own) one myself, but as far as output for MOD files goes, I prefer Microdeal's Stereo Replay. Unfortunately, there are no trackers available that take input from Stereo Replay yet.

Karl 0ygard (now that I am on this subject), I will send you that source code for ProTracker to get input/output from/to Stereo Replay. This should give you "one up" on your competitors. Audio Sculpture doesn't (says it does, but doesn't play all 4 channels thru Stereo Replay), TCB Tracker doesn't (period!), and ProTracker (v 1.2) doesn't (yet, but should soon!). :-)

> something undocumented anyway?

Back in the Fall of 1986, STart magazine published an article by David Small
entitled "Probing the FDC". In the article, he refers to the floppy disk
routines in the BIOS as follows:

"Atari wrote a great deal of software to run the floppy disk. It
is sent to all developers as FLOP.S in the BIOS listing."

He further goes on:

"The TRAKREAD program on your START disk uses Atari's own BIOS
routines. (Atari gave me permission to reprint them, thank
heaven.) I weeded out things that were not essential for the
task at hand (such as the Vertical Blank handler) and shortened,
straightened, and commented the code for your reference.

I use Atari's calling protocol for everything because, when you
switch from this program to the real BIOS, everything will
remain consistent."

The last sentence is an indication of 'good programming technique'.

First please speak english in comp.sys.atari.st (look at crosspostings)
For the non germain speaking readers of c.s.a.s this is what it says
(roughly)

"Very nice, but what can I do with it. Without telephone numbers I can't
get to it or is their something that I don't know as new reader.
Would be nice if someone can explain this."

Well here is your explanation. FTP is a feature that can only be used if
you have a direct internet connection. The numbers behind the name are
internet adresses. Some sites also run a mail-server read the monthly
posting about comp.sys.atari.st for details or read the complete list
of all anonymous ftp sites. Unfortunatly I don't remember where you can
find it something with odin and pilot in it.

Well over here in NZ. if you mention they are for a Mac, they slap
another 50% on, far cheaper to bye 9 bit PC SIMMS.

This also ould be that they shift more PC SIMMS.

Note: The first Demo STE 4096 that we saw here, was fitted with
9 bit SIMMS..

3568. SPECTRE PARTITION SIZES

Newsgroup: comp.sys.atari.st
Date: 1991-10-16 14:55:40 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Oct16.145540.1351@magnus.acs.ohio-state.edu>
Source record: 227989

A little while back I posted a message saying that by reducing the size of your Spectre Boot partition you could decrease your boot time by large amounts. Recently someone wrote to me saying that he had tried this and that it did not work. As it turns out, he already had a 6meg partition as his boot partition in the first place. On the other hand, I had gone from 22megs to 3megs on my boot partition. From my experience there is not much speed difference between say 3 and 8 megs (maybe even 10), so if you already have a small partition, then don't bother reducing your partition size further unless you really want to, because the speed increase will be minimal. However, if you have a huge partition like I did, then the smaller size will make a very noticible speed increase. With about 20 cdevs and inits, including some that have to grab tons of RAM (makes them load slower), such as ATM and True Type, my boot time went from 45 seconds to 15 seconds (faster than any MAC I've ever seen by the way). I'm using 28ms 50meg ICD drives, so results may vary depending on what hardware you are using.

I'm not sure about your SIMMs. I always thought 100ns 1Megx8 were standard issue for STe's. Has Atari gone with some Mickey Mouse proprietary standard? My 1040ST has the JRI memory expansion, and 4 Meg of the above named SIMMs.

As for your mouse reversal problems, congratulations, you've caught the infamous mouse reversal virus. I'd suggest you get ahold of a virus checker program like VKILLER and "disinfect" all your disks.

Cheers!

3571. WANTED: GIF --> SPC converter

Newsgroup: comp.sys.atari.st
Date: 1991-10-16 17:39:21 UTC
From: steveg@cseic.saic.com
Message-ID: <3915450@MVB.SAIC.COM>
Source record: 228067
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm looking for a *high-quality* GIF to Spectrum converter that runs in a
BATCH mode. (Feed it a list of files to convert, and let it fly).
It wouldn't hurt if portable source was included so I could run conversions
overnight on a Un*x machine.

DMJ GIF 2.0 produces the best conversions I've seen to date, but takes up to
1/2 an hour to perform the conversion on a stock ST, or 17 minutes with
AdSpeed running @ 16MHz, but that's still too slow to wait around for.

Can anyone provide me with a batch converter with comparable output quality?
Even if it's slower, the ability to convert overnight will provide me with
better 'throughput'.

>owning an Atari computer? Why not just tell 'em: "I need four 1 meg by
>8 Mac-type (as opposed to PC-type) SIMMs, 80 nanoseconds or better, for
>my Atari computer"?

Seriously, some of these "Mac" places clamp up when you mention its for
something other than a Mac.. When I ordered an Hard Drive from Club Mac
they told me their drives wouldn't work on an Amiga, so I called back 10
minutes later and told them I had a Mac IIcx...I even had CompUSA tell me
the pinout of my A3000 is totally different from a Mac's 25db SCSI
connector.. Its just that they don't know, and don't want to know...

Alot of places just don't want to get into a tech support nightmare selling
something that doesn't work with a certain machine. When you sell something,
you make more money if you never have a call back on the item and have to
provide techinal support..

Message-ID: <1991Oct16.200308.613@garfield.cs.mun.ca>
Source record: 228054

Are there any commercial MOD file players that support stereo by using the ST sound chip for one channel and the ST Replay (or Digisound) cartridge for the other? I have the latter and use DigiComposer to get stereo this way. The program's not bad, but contains several bugs and is lacking in a few areas (particularly when manipulating samples). I've gathered quite a collection of MOD files and would like to have a better program to play them with.

3576. Help with a printing problem.

Newsgroup: comp.sys.atari.st
Date: 1991-10-16 21:02:10 UTC
From: rts@polari.uucp
Message-ID: <1991Oct16.210210.22245@polari.uucp>
Source record: 228055

Hello folks, I need help with something.
When I do a screen dump, or I use programs that do. My printer fires up
and starts printing away just fine, except one thing.

about 20% of the right side of the image, text or graphics, is not there.
The printer is filling up the paper, but it looks as if the image is
offset. Well, a better description is that my screen is 80 colums but the
paper image looks like its about 132, with everything above 80 missing.
There is always a boarder on the right side. It just seems like the screen
dump is not sizing the image to fit the paper. Anyone have any ideas?

My system:

1040 stf
C.itoh Prowriter Jr. printer

Thanks.

> I'm interested in something for my ST that is like Unix in that it has cat, vi, uue, uud etc all in one package, with the ability to run and compile "c" programmes. I have taken a look at gulam, it looks nice, but it is rather incomplete. For instance it does not have vi (something called "ue" which looks interesting) and I don't think it can run c programs.. :(:(
>

I don't think you will find a shell which have all that stuff included but if you look around in atari.archive you will find all of it somewhere.

Gulam can run any kind of program including a C-compiler just have to purchase one somewhere (a.a look for sozobon or GNU-gcc)

The programs you mentioned are standalone programs, it the same for the UNIX variants only almost any UNIX version include these programs in the utility list but that does not mean that they are part of the system.

That what I call either ignorant or convident

> I thought simms were simms why are theses chips different?
Atari always finds a standard that is slightly different from what you
expect.

> Can I really upgrade my machine to 4 megs?
Yes, perhaps even more

> And now for something completely different.
> Whenever I turn my machine on with a disk in the drive, the mouse

I think it is time for a thorough virus check look for a good virus killer
like SAGROTAN 4.17 or VKILLER. Sounds like a virus I heared off.

No I'm NOT ashamed of being an STe owner. Just disgusted with the attitude
of various companies that act like the ST doesn't even exist. So instead
of having a company REFUSE to sell me SIMMS because they won't back them
up when used in a machine they've NEVER heard of, I told them I had a mac

(Actually, in a way I do, All I use the ST for is running Spectre)

So if that makes you laugh yourself out of you chair, so be it. I guess it
doesn't take much to amuse you, eh?

3580. WAACE Show REPORT

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 00:37:17 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1991Oct16.203717.12450@umiami.ir.miami.edu>
Source record: 228060

Well, I went to the WAACE show over the weekend and must say I was impressed. This being my first Atari Specific Show, I was quite relieved to see a large amount of people there. Word has it that the show housed total around 2200. Atari was NOT there except for the presence of Bob Brodie and 2 TOS programers. Bob held a question/answer period where he apologized for Atari's lack of support for the show. He went on to explain that COMDEX is this weekend and Atari just couldn't handle both shows. And COMDEX does have a slight lead over WAACE.
Anyway, who was there? The NEW Michtron who were showing off two new games, Big BUisness and Prime Time 2. Both are played in the same style of Prime Time and are quite anjoyable. Look for Prime Time 2 in about a month, Big Buisness is out now.
Omnimon Perhemprials Inc. was there too showing off their new graphics board. VERY impressive. The next version of Prisim paint will support it and is due early next year. They also had OMNIMONS to sell, I already own and recommend it HIGHLY, and DEKAS.
Phil Counea Software was there with his GRAMSLAMMER and the new version Gramslam Expert. BOth are excellent products. Gribnif was there with new versions of much software including Steno and Stalker. Current Notes was there as well as Atari Explorer, ZNET, ST Reports, and ST Informer.
Codehead was showing off the new VECTOR drawing and manipulating program AVANTVECTOR. It was REALLY impressive and beats Anything I've seen on a Mac or IBM. They also had updates for current software.
Gadgets by Small and FAST Technologies both had their 030 boards there. BOth were equally impresive but way out of my league. BTW, FAST Technologies donated a Turbo20 accelerator to the Dorr Prizes which I won. Thanks guys.

There wer more dealers and developers, but those are th highlights. Look for TOS 2.6 for the ST sometime soon says Bob Brodie!

3581. TeX joy, LaTeX woes.

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 00:41:35 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <4892@tamsun.TAMU.EDU>
Source record: 228051

Well, thanks to many suggestions, the most helpful were from Terry Reeves and Jeffrey Jackson.

Boy, this "So, It's Your First Time to Install TeX on Your ST" is going to have lots of advice in it.

I finally got TeX to work, but I can't see or output TeX .dvi files. I am now working on getting the "dvieps" programs to work with my Panasonic 24 pin Epson compatible.

This is the strange thing. After successfully building the "plain.fmt" file, I took to building the "lplain.fmt" file for LaTeX. It builds fine till it starts to build the fonts. After building many of the fonts, LaTeX looses one, and says it doesn't exist, and TeX exits with an error code. I write down the missing font name and then check to see if the font exists. Sure enough the font is missing, and in fact THE "d:\tex\fonts" DIRECTORY NOW ONLY HAS *THREE* FONTS IN IT! Since I can't believe it, I do "ls d:\tex\fonts" in gulam again, and now the directory is empty! Woah! I rebooted the computer and the fonts were back again. OK--- I know, the old folder limit, FOLDR300.PRG was to small, I should be happy now filesystem damage was done. I up it to FOLDR750.PRG and start over. BINGO, I get more fonts in, but then TEX stops building LaTeX will another font.

Where do I go from here? I have 2.5Mg of RAM and 8Mg free on the hard disk. You LaTeX people, have you built the LaTeX.fmt files?

Thanks

Source record: 228057

Does ANYONE have an Unscruncher for the ST?
I have a file i can't convert. and it's really getting on my nerves that i can't find it through out the various FTP sites i know of.
this scrunch is like MSA but is SCRUNCH-ed. unscrunched of course would mean that the file i have would uncompact to a full disk.
does anyone out there have an unscruncher and could either tell me the FTP site where i could get it, or UUencode and mail it to me?

thank you!

maybe even in IBM format? (what else is PCditto for eh?)

Thanks!
Timothy Wilson

Solution: Select "Control Panel" under Desk. Then, select "Install Printer".
Then, change the pixels/line from 1280 to 960. That should do it.

In <CMM.0.90.2.687630017.larserio@kolsaas.ifi.uio.no> larserio@IFI.UIO.NO (LarsErikOsterud) writes:

>I run FSII on my MEGA STE (even in 16 Mhz with cache), no problem.
>In 16 MHz the scrolling is much smoother too - great !!!!

I think i have an explanation of the various success/failure stories:

When I bought FSII, I had a STe with a Megafile 30, and I noticed that although it was stated in the manual that you could run it from harddisk, this dit not work for me. Therefore, I only ran it from floppy with the harddisk switched off.

After that, I bought a Mega STe. And I discovered that I could not run FSII at all, so I took
out a disassembler and tried to find the cause. It appears that there is a loader program, FS2.PRG, that loads and relocates the code from either the color or monochrome version of FSII. However, *IT LOADS THE PROGRAM TO A FIXED ADDRESS*, $28000. This may, or may not be an address that is already used by other programs, but if you have a harddisk with some ACC's, a disk cache, or The FOLDRxxx.PRG program it is very likely that the ram at that address *is* in use. To prove this to myself, I have de-installed the auto-boot disk-driver, and started FSII directly from floppy.
It worked!

I've tried changing the loader/relocator program to use an other address, but for some reason this worked only on rare occasions, and I've not been able to find a pattern in them.

I've also written to SubLOGIC, but their reply was in essence "thank you for the letter, we've forwarded it to the technical department, and since you have registrated your program, we'll keep you informed about upgrades of the program." Not very helpful.

To prevent any questions in this area: I am *NOT* prepared to send you sources of my modified version of the loader/relocator. This is to prevent any copyright problems. However, you can repeat my work very easily with a good disassembler and assembler.

> Greetings... - Jan -

A slight correction to the above: most STs in the UK are probably sold
with NO monitor - games freaks plug the ST in to their TV set via the
modulator port.

Atari UK are now trying to move a bit away from their games orientation,
but it's not yet clear if they're having any success or if they have the
resources to do it properly.

>I'm not sure about your SIMMs. I always thought 100ns 1Megx8 were standard
>issue for STe's. Has Atari gone with some Mickey Mouse proprietary standard?
>My 1040ST has the JRI memory expansion, and 4 Meg of the above named SIMMs.
>
The STe needs 8 bits. If you use PC (9-bits)-SiMM, one bit is simply not used.
All SIMM's are created equal (pin-layout that is :-), and anything from 120ns
and downwards will work (8 MHz or Mega STe (false) 16MHz). It is even possible
to mix 8 and 9 bits SIMM.
8-bits are also used in Macintosh (even though any Mac can use 9-bits).
9-bits are used in IBM-clones. The nineth bit is a parity-bit, used to
detect memory faults. Of course the price slightly higher for 9-bits, as
there is one more chip on them.

>As for your mouse reversal problems, congratulations, you've caught the
>infamous mouse reversal virus. I'd suggest you get ahold of a virus checker
>program like VKILLER and "disinfect" all your disks.
>
Yeah, nasty one, you can't make the disc immune to this, as it doesn't bother
to check if it is already present. May corrupt FAT if you make a reset at the
wrong moment.

comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Jeff Weiner will only forward them to Jon, so please save him the time. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter e-mail address in response to Password prompt>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

The mail server has also moved. Send an e-mail message to

info-server@ftp.Informatik.Uni-dortmund.DE

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be a valid internet or uucp address. For bitnet users name@host.BITNET usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl26.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5

```
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

```
Number
Description of bombs

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordFlair, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

HAM
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.1) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran

by newly acquired SIG Operator, Peter Haller, a professional programmer
who is running developer sections on hardware and software development,
programming, MIDI applications development, Graphics Design,
plus many other sections that can definitely become a programmer and
developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured
Product Info and Support Board and a new Special Applications Board.
The Support Board includes a vast library of support lists. These lists
range anywhere from phone numbers of Atari dealers and producers, to
software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software.
To sum it all up this area covers what's out there, who makes it, and how
to get it for all Atari products. The Special Applications Board is
just starting out. Currently there is an area for users of MIDI on the
ST. MIDI users are encouraged to use this as a means to discuss MIDI
related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it
via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu"
or by calling (216) 368-3888 300/1200/2400 bps. Once on the system,
a user can apply for an account application and logon as a visitor.
Once here, simply type "Go Atari" to get to the Atari SIG. A visitor
can go anywhere on the Freenet and can read anything. They can't
post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair
Atari SIG Public Relations

Internet e-mail: aa338@Cleveland.Freenet.edu
CIS e-mail : internet>aa338@Cleveland.Freenet.edu

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost

of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews, or more information on other magazines, please send them to me via e-mail. As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free [$6.00/50 magazine shipping charge] from participating computer dealers, bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year) Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine (Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people.
Lively, but of uneven quality. Big leisure section, but other areas
covered too. Includes cover disk - mix of games demos and (usually out
of date) PD utilities. Probably the biggest-selling UK ST mag. Has had
several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper
(monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2,
D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

BOOKS
What books are available for the Atari ST?

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

>definitely does NOT support track skewing.

Well, look again. TOS 1.2 was the first to support sector skewing (you set
the interleave to -1 and make the "filler" longword point to a table of
sector numbers). It is true that TOS 1.0 didn't support it, but all the TOS
releases since _do_ support it.

>and isn't the DMA system

No, the DMA system _is_ documented. (It's there in my documentation).

First you say that the DMA system is undocumented, then you say that you
don't know what the documents say... Hmm.

>
>Also, it wasn't "good" programming technique, even by your definition...

There is nothing in the spec. sheet of the WD1772 that says that the sector
after the index pulse must be sector one.

3600. Re: HPLJ IIIP

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 12:49:18 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <1662@know.pws.ma30.bull.com>
Source record: 228066

For the individual who was asking about the HPLJ IIIP, if you use downloaded fonts or have a postscript board in the HPLJ then you will get good performance from the ST/HPLJ or TT/HPLJ combo. However, if you use bitmapped fonts or have bitmapped graphics (such as digitized pics) the HPLJ without postscript will be VERY, VERY slow (it will be slow connected to any computer that wants to send bitmapped info down the parallel or serial ports). Want speed and quality. Use an Atari SLM605 laser. It will outperform the HPLJ IIIP for speed and you'll need a magnifying glass to see the difference in output quality compared to an HPLJ. I know; I use an Atari SLM605 at home with my Mega and an HPLJ printer with my TT at work. By far, I prefer the set host cc4
csullogg
qwerty3
the SLM605's performance. Oops, ignore the stray info in this message; by accident I hit the wrong key and STalker 2 inserted spurious text from the function key defs.

If you need more info, please contact me directly.

The ST assumes that you have an Atari printer connected by default. The
Atari dot matrix has a higher dots-per-inch graphics mode than the standard
Epson graphics mode (which everyone else emulates).

Use the control panel printer setup to set the printer width to the smaller
of the two alternative values (I can't remember what the two numbers are off
hand -- just pick the smaller one!)

Just a note people, I couldn't believe it, but when I got into work, sat down, and low and behold started reading my latest Computer Design Mag, the section on RISC vs CISC had ATARI plastered all over it, with a story from one of Atari's senior hardware engineers discussing why they are using the current 020 core cpu from Motorola to design .. something.. he wasn't too specific, but probably was talking about the Jaguar.

3606. Font addresses

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 14:56:44 UTC
From: clash@aslan.en.open.de
Message-ID: <9110171656@aslan.en.open.de>
Source record: 228114

Hya buddies!

Who can tell me how to get the address of the TOS-font independent from
the TOS version? I already know how to get it using TOS 1.02, but now I
have TOS 1.04 and the addresses are not the same. I tried to get it by
testing with GfA-Basic but I had no success. I couldn't get the address
for the font used by GEM (not GDOS!).
There are two addresses, one for TOS output (like PRINT in GfA-Basic),
the other for GEM output (like TEXT in GfA-Basic) and a third one for the
8*8 pixel font. That address would be interesting for me, too.

Looking forward for your answer...
Oliver

Hello,

I am looking for the french version of the 1ST_WORDPLUS Program
for the Atari ST or any other text processor with a french
dictionary. It is for a friend of mine; she is particularly
interested in the french dictionary for automatic spell checking.

I anybody got this or any other similar program or even only the
french dictionary, please send me via email or diskette.
If you send a diskette, I will of course send the diskette back
along with german software, if you want. Just tell me what kind of
software or which program you want.

Thank you,
or I should better say : Merci!

I've heard rumor that Dave Small may be considering doing a full-color mac emulator for the TT (and SST/w color cards). He would be using the NuTek roms. It has also been mentioned that if we want to see this product we might want to let Dave know. I would encourage everyone who is interested (and even those who aren't, just to help out), call him and let him know with a SHORT message. I'm sure that he does not want to hounded. Also, if he decides not to make such a product, I hope people won't turn angry on him like I've seen a tendency to do in the Atari world: It is his company and he can do what he wants.

3614. whining HD

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 18:57:34 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Oct17.185734.28166@rodan.acs.syr.edu>
Source record: 228089

Does anybody have any suggestions for help with my CDC 40 meg HD (in an ICD FAST) setup that has worked well for a couple of years but has started to whine when it comes up to speed for ST boot-up? You see, when I start it now, it starts fine, but then when it clicks into the mode when it is ready for the ST, it starts to whine. I can get it to work by powering up and down a few times, but I'm wondering if there is some way to fix this problem more permanently? Or am I going to have a dead drive soon?
Thanks,
Gerry

>switched on again?

Of course it is. Simply switch on the 1040 before switching on your hard disk.
Now you have to start your hard disk driver, e.g. AHDI, from disk. Now you
can access the hard disk as usual and you can delete or rename the file that
caused the troubles.

3616. Atari Minix and ICD

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 20:24:05 UTC
From: malay@sae.com
Message-ID: <1991Oct17.202405.1270@sae.com>
Source record: 228090

Has anybody installed Minix on the Atari ST using a hard drive with an ICD host adapter. After reading the installation instructions for Minix I've become confused - Minix expects to see only 4 disk partitions - ICD allows more than this - is this a problem?? Will having disk partitions after the fourth one (/dev/hd4) cause strange things to happen. This is the setup I want :

```
partition drive type
1 C Atari TOS
2 D Atari TOS
3 E Minix (root)
4 F Minix (usr)
5 G Spectre
6 H Spectre
```

Any problems with this setup??

Bob Malay

3617. START's cute uncompress program

Newsgroup: comp.sys.atari.st
Date: 1991-10-17 22:12:24 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <GAUDREAU.91Oct17181224@juggler.East.Sun.COM>
Source record: 228085

In the latter days of Start magazine's disk compression, they used
a self-extracting archive format (DC something).

Works quite well on vintage ST's but not on a Mega4/Ste. Anyone know
how to unsquish these files? It's really be nice if I could convert
the last of my Start disks into usable material...

Lastly, Volume 5, #'s 1-3 has an article about programming the blitter
that was quite lovely. Sorta elegant in it's way. Good stuff.

Grins,

Joe

>switched on again?

Yep. Put any old disk (except one with AHDI) in the flopply drive, turn on
HD, wait, turn of computer, hold ALT, run AHDI from floppy, install C drive,
delete mean AUTO program... reboot.

3622. More TeX/LaTeX

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 03:55:40 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <4928@tamsun.TAMU.EDU>
Source record: 228092

Thanks for the help setting up TeX and LaTeX. I now have TeX (and I think LaTeX) working. I can view things with the screen previewers.

I have two project before releasing a "So, this is your first time installing TeX on the Atari ST!" document.

1) Make the "dviprint" program use fonts for my Panasonic 24pin (EPSON LQ-1500 clone).

2) Understand the font naming conventions. I understand that the "fonts" directory should have directories named after a font, and should contain font files with names like "100pk". Also, the "fonts" direcotry should have files containing "fontname.tfm" in it.

I don't understand this convention yet. I also, need to need what "flibs" does. I am trying to piece it together with the minimal documentation of the "dviprint" and "showdvi" ".fnt" files, but I am having a tough time deciefering it all.

By the way, I want to post the final document on "terminator" in Michigan. Someone please send me the guidelines for submiting to "terminator."

Since 7 people have mailed me help messages, and 31 people have mailed me requests to share the info, I will post useful information to comp.sys.atari.st.

3623. ForST

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 04:20:08 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1991Oct18.042008.4982@csi.uottawa.ca>
Source record: 228098

I have just uploaded to the atari archive at University of Michigan the ForST package. It's currently in /atari/new/forst.zoo. I presume that the system "gods" will be moving it to /atari/languages/forst.zoo Real Soon Now (TM).

The remainder of this posting is an excerpt from the documentation, with some of the more obscure technical information (uninteresting to much of the world) removed.

OUTLINE OF THE ForST PACKAGE
(A Fast Optimizing Forth for the Atari ST)
Written by John Redmond
General

The present version of ForST is placed in the public domain for non-profit use. This includes the object files and assembly source files used to generate it. The origin of the files must be acknowledged at all times.

ForST is written for the Atari ST, any version, with any number of drives and (preferably) a monochrome monitor. The assembly source code, suitable for DevPac ST2 assembler, has been modularised to simplify porting to other 68000 systems.

It is a 32-bit, position-independent, subroutine-threaded system with macro expansion and two-edged peephole optimisation. Compiled code is at least as good as that from other ST compilers (eg, 100 iterations of the Sieve in just over 25 seconds).

Separated headers are used, which can selectively be removed. Local and register variables are available, adding significantly to the efficiency of the compiled code and to the source readability. No assembler is included, as it is not really necessary and detracts from the portability of code. Using register primitives, much the same result can be obtained.

An illustrative library is provided, including a floating point package.

Assembly source

The details of the use of these source files (in SOURCE directory) is given in FORST.DOC. Using DevPac ST2, they are sufficient for reassembly of the entire system.

Executable files

FORST.TOS: obtained from assembling FORST.S.
FORSTX.S: an enhancement of this, as described in FORST.DOC.

Either of these can be run from the desktop, simply by double-clicking on it.

ForST library files

These are in the LIB directory, and are included to illustrate extended Forth (ForST) style. They are placed in the public domain with sole requirement that their authorship be acknowledged.

I would like to sell my Mark Williams C compiler. This comiler
includes:
- Complete ST C compiler with GEM and UNIX-like calls
- csd source level debugger
- resource editor
- MicroEMACS full screen editor
- Microshell unix-style shell
- RAM disk
- full-featured assember
- Make
- and complete documetation

The version is 3.0.6. In my opinion, this is the best and most
complete compiler available for the ST. I used it for a couple of
years with minimal problems. I would like to get $75 dollars for it +
postage, or best offer.

I looked at Delirious Demo 2.75 which I got from atari.archive, and that
one does not run on my TT, despite the fact that it has the same periphs
as the STe. Probably 68000 specific interrupt vector handling....
Also I checked out the finale_p[12].msa from atari.archive. This one is
completely dead on the TT. Delirious demo anyway says it is loading
and then hangs (with floppy light on).

Has anyone gotten these to run on a TT?
Or are there perhaps other interesting demos floating around for the TT?

Message-ID: <1991Oct18.073816.523@elroy.jpl.nasa.gov>
Source record: 228103

I took a more brute-force approach... This is from my ansi
header file...

```
#ifdef ANSIPROTO
#define __ARGS(x) x
#define __DEC1(v1,d1) \
(d1)
#define __DEC2(v1,v2,d1,d2) \
(d1,d2)
...
#define __DEC9(v1,v2,v3,v4,v5,v6,v7,v8,v9,d1,d2,d3,d4,d5,d6,d7,d8,d9) \
(d1,d2,d3,d4,d5,d6,d7,d8,d9)
#else
#define __ARGS(x) ()
#define __DEC1(v1,d1) \
(v1) \
d1;
#define __DEC2(v1,v2,d1,d2) \
(v1,v2) \
d1; \
d2;
...
#endif
```

So you declare a function

```
int main __ARGS(int argc, char *argv[]);
```

and

```
int
main __DEC2(argc,argv,
int argc,
char *argv[])
```

Keeps things looking pretty much like they used to, but it does the
right thing... Only wish I didn't need 9 versions of each macro...

```

3627. ARC 5.xx

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 07:53:36 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1991Oct18.075336.786@elroy.jpl.nasa.gov>
Source record: 228106
Cross-posted to: comp.sys.atari.st,comp.sources.d

So, are any of you folks still using ARC 5.21, or have you all moved on to ARC 6, LHArc, ZIP, or ZOO? This is a little more than idle curiosity, obviously. I've rewritten a fair amount of the ARC 5.21 code and compiled with gcc, making it twice as fast now as the previous version for all operations. It is also twice as fast as ARC 6.02 for unsqueezing, and about 20-30% faster for uncrunching old-style crunch files. It tends to be from 5% slower to 10% faster than ARC 6.02 for regular crunch and uncrunch. There was also a bug in the old squash code, which is now fixed. (Actually, the Lempel Zev crunch/uncrunch is *much* faster even than ARC 6 or Unix compress, but the Huffman squeeze pass adds a couple seconds to the run time... And I still find lots of files that compress better with a squeeze, so it still seems worthwhile to keep the code.)

The other reason for the question - is it worthwhile to port ARC 6 to Unix? Now that there is a pd ZIP for Unix, I'm not so sure...

This raises an interesting question of my own. I have a MegaFile 30 by
Atari, and often I hear it "beeping". Chirping might be a better word.
Usually I hear the sound on writes to the drive. Is this normal?
Anyone?

I run FSII on my TT all the time with no problems, as long as I turn the caching of first, but this is only so the display doesn't flicker.

It runs fine from the hard disk (on my ST and TT) as long as there is NO DISK CACHE. The disk cache seems to play havoc with the poor program.

Ashamed? Well no. But when one looks at Atari's 'achievements' in the computer world one can hardly be proud either.

>Do you really expect to get looks of leprous contempt when you say the
>word "Atari" at a place where you might buy SIMMs? You shouldn't.

Maybe not in a chip merchants but probably in a Mac dealership. I doubt a Mac dealer will be very helpful once he knows the SIMMs are not for a Mac. Spectre owners proudly tell Mac dealerships they want such-and-such for their Mac emulator but after being treated like a moron they generally pretend to have a Mac.

>You might get a surprised look as the uninformed chip merchant wonders why
>you'd need SIMMs for your video game.

Which in the UK is what Atari sells the ST as.

Why do you think this way?
Mmm? Perhaps there is a clue in in *YOUR* signature :-) x 1E3

I presume your using a versoin of TOS prior to 1.4? I don't remember any of
these problems when I tried to build TeX (my config, 4meg STe, TOS 1.60, at
the time, about 10 meg disk space).

If you can find a machine with TOS 1.4, try it on that.

3633. Re: Mega STe

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 11:17:56 UTC
From: s_grunwa@irau26.ira.uka.de
Message-ID: <kftgn4INNlg4@iraul1.ira.uka.de>
Source record: 228107

They are about 50 to 70% faster in practice. You notice the difference
at once, at least it you have worked a bit and then try an old ST.

Compatibility problems:
The STe scrolling and screen flip. This will be fixed by Atari.
This problem does mainly occur with games on the monochrome screen
and has never occured (by me) with application like text or DTP
programs or compilers.

An other Problem is the position of the TOS-ROMs. Since they are now
256k the address has moved, which may fool poorly programmed
applications. (unfortunately this may be your favorite PD-Program).

The rest of the machine is fine, but here are some tips:

Try to get a bigger HardDisk. e.g. Buy the machine without HD and get
a 100 MB Quantum or Connor. Esspecially the Connor reduces the noise
substantial. The 48 MB will fill up very fast.

Try to get it with 4 MB or make the upgrade with SIMM's at once.
2 MB are fine, but 4 MB are better and the extra cost is not much
compared to the machines price.

Try to get it with the 68881 included. It costs only 99 DM in Germany
and, if you use TurboC 2.0 it is supported. Any floating point
application benefits from it and the price is like the memories price
realy low. I measured a speedup of 2 for +,_,*,/ and >4 for sin,cos.
That's a lot for 99 DM.
If will never need floating point leave it out, but think about it.

The packet price may make the upgrades even cheaper, since a lot of
shop give you percentage on the device, but not on parts. Also changing
the Harddisk against a bigger one is not always possible or you will
have a big loss.

Knut Grunwald, s_grunwa@ira.uka.de

3634. Re: What's been goin' on since 1988?

Newsgroup: comp.sys.atari.st

Source record: 228118

I agree with the replier and want to add two things:

1. If you want to use a bigscreen, inform yourself befor buying a
Mega STe or TT (the rest is more or less out of time, since a
1040 STe with HD and at least 2 Meg is more expensive as a Mega
STe 2).
The Mega STe is a lot cheaper if you use only the normal resolution,
but the bigscreen cost a minimum of 2500.- DM and, if you have no
low price dealer near you or want service (at that price would
recommend it), i will cost about 3500,- DM. This is a lot more then
the TTM 194 price, which is about 2000,- DM (list price ?!!).

2. The TT supports expansion above 4 MB, which adds another cost
advantage at expansion. Also it include the coprozessor, which will
speed up floating point a lot. FP is used for DTP !!

3. A 16 MHZ 68000 is not near the performance of a 32 MHZ 68030. So the
TT has a lot of extra bang.

4. The Mega STE is more compatible than the TT.

So you have to make the decision before you buy one of these, because
there is no upgrade path.
I made my decision for the Mega STE, because i don't need the bigscreen
(it is nice to have one) and the compatability of the Mega is bigger.
But anytime i look at the a TT-highres-monitor i feel a bit like having
made the wrong decision, although my bank tells me just the other way
round. So think carefull, at best try both machines for some time (two
weeks or at least a project of a full day like typing in and formatting
an article or so).

Knut Grunwald, s_grunwa@ira.uka.de
Pricing in DM:
Mega STE 4 -> 2800
TT 4 without Monitor -> 3600 + VGA -> 4300
= The Mega is 1500 DM cheaper (street prices are even cheaper)

Mega STE 4 + 68881 + Protar 19'' -> 2800+100+2500..3500 -> 5400..6400
TT 4 with TTM 194 -> 3600 + 2000 -> 5600
You don't need the VGA so an extra 700 DM spare
The Mega is only 200 DM cheaper in the best case !!!!

3635. Batch Files?

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 12:19:59 UTC
From: hs0tc@gdt.bath.ac.uk
Message-ID: <1991Oct18.121959.1982@gdt.bath.ac.uk>
Source record: 228122

Okay I have a problem.
Having used MSDOS for a while and gotten used to the batch files available,
is there any similar process on an Atari ST?
Failing that, I'm looking for a way to boot up certain programs only,
depending on the screen resolution. All help's appreciated!

Thanks in advance,

Tim Cooke

Why do people keep asking for articles to be posted only in English? A lot of the action on the ST takes place in Europe. It seems to be that it is best to let people post in what ever language they know. That way those of us who can read it can make use of it, and the rest of us can easily ignore it.

Be that as it may, this group does have a lot more readers of English than of other languages.

If people are going to use ARC 6, then yes, I would like a version
that runs on Unix. I don't know if there is any reason to use ARC 6
given the availability of ZOO 2.1.

I've had whining problems with two hard drives in the past. The problem both times was the grounding brush that touches the end of the spindle. A simple cure is to place a piece of tape on top of it, if you can access it. This seems not to interfere with the functioning of the brush, but it damps out the vibrations and prevents oscillation.

>doesn't this take advantage of a certain bug/feature in the hardware?
>Namely, that the sector directly after the index pulse does not have to
>be numbered 1?

There is no specified order of sectors on the disk. If you wanted to, you could format a disk with more than one sector of the same number on the same track. The FDC picks up and uses the first one it finds irrespective of where it is found. That's not a bug or a feature, rather the way the FDC does what it is supposed to do.

An active imagination is necessary to find some useful way of exploiting multiple occurences of the same sector number, and you might get into trouble with some higher parts of the OS. The only obvious use for this (and it works) is to have the boot sector repeated all over side0 of track00 so that if the first one gets damaged the next one will be picked up instead, like a cat with nine lives. (or more if it's been upgraded :-)
Don't forget to reserve the right number of sectors in the diskBPB of each copy, and write the whole track in one go.

>And now what's going to happen, now that Western Digital isn't making
>WD1772's anymore? Will this hardware bug/feature still be present?

Feature only in the sense that it's meant to be that way. Feature in this context usually means an unintentional inconsistency (or an accidental improvement). I'm sure that this is part of the specification, since the main purpose of the index pulse is to synchronise and limit the format track command and for handling timeouts.

VLSI is still making VL1772's. There are other FDC's (most?) that don't rely on the physical location of sector 1. In fact, I would be inclined to call it a bug if the FDC did rely on that.

Atari Abaq? Oh yeah, I remember that piece of junk.

The whole idea with that machine was the concept of "processor farming".

You could add as many processors you like to get some form of scalable
architecture..(from ATARI, WOW Huh?).

Well, it was a cruel joke, and I think only the most die hard of people
ever got one, short of sucking up and kissing Jack's behind.

It was an amazing machine though, as far as I could tell.

Just another failure thats all.

>It worked!

Thank you for the opportunity to discuss the question "why doesn't program
X work on machine Y?"

Program X might have been written by real dingbats, that's why.

It might load at an explicit address. It might use really low memory in an
attempt to foil debuggers, and using that memory might not be as harmless
as it was in the TOS version the author designed it for. It might assume
that ROM starts at $FC0000. It might demand (inexplicably) that a certain
system buffer appear below address $1000, as Crack'ed does. It might
clobber a system resource (like Timer C) and then expect BIOS calls to go
on working.

It might run off the end of memory looking for something above phystop,
with a guard against doing that on a 4-meg machine: ST's won't give bombs
when you access non-existent memory under 4MB, but STe and TT will.
The Shadow (background-download) detection code does this.

It might have a bug that wasn't fatal in old TOSes, like I recently found
in Starglider: it has this instruction

move.b $df,$fffa0f

instead of this one:

move.b #$df,$fffa0f

The second one clears a single bit in the MFP in-service register the first
moves whatever value happens to be in memory at $df into that register.
Since $df is the low byte of an exception vector that isn't used, you're at
the mercy of the address where the bomb handler landed in ROM.

My point is that we just can't fix these things. I don't like the fact
that Starglider doesn't work under new TOS, but I can't help it.

3651. DataLink 1.00

Newsgroup: comp.sys.atari.st
Date: 1991-10-18 21:06:27 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <g67102w164w@ersys.edmonton.ab.ca>
Source record: 228139
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello. DataLink 1.00, a new communications program, has just been uploaded to atari.archive.umich.edu and will soon be available. The filename is currently DATALINK.ZOO. Following is an excerpt from the text file included in the DataLink archive.

D I S T R I B U T I O N

You may upload this archive anywhere you please, so long as the information contained within it is not altered in any way. DataLink *can* be included on User Group disks that are being sold, but may not be sold for profit.

D A T A L I N K F E A T U R E S

Welcome to the wonderful world of telecommunications!

DataLink is the newest program to hit the market, and chances are it's just right for you. Some of the best features found in commercial telecommunications programs are now at your fingertips.

An easy to use Group Dialer will let you select a group of BBS systems to call, and then dial each one in the sequence until you have connected to every board in the chain.

The normal dialer used by DataLink will dial a BBS system until you connect, keeping track of how long you have been dialing, how many "BUSY", "NO CARRIER", and "NO DIALTONE" messages have occurred, and how many times you have dialed.

Both of DataLink's dialers show the name, the number, a comment, and the baud rate of the BBS being dialed. You can store up to fifty BBS systems, along with the appropriate information, in each dialing directory. There is no limit to the number of dialing directories you can maintain.

DataLink also provides you with a complete set of disk utilities, including copy, move, delete, rename, print, make folder, delete folder, touch file, append file, and free disk space.

Do you ever get tired of typing in your name and password every time you want to log-on to a BBS system? Sure you do. DataLink will allow you to put this annoying problem behind you

forever. You can enter up to ten strings which DataLink will search for, and up to ten strings to reply with when the search strings are found.

DataLink also provides you with a 32K buffer so that you don't miss important information. The buffer is saved automatically when it fills. Or, if you want to save disk space, you can set the buffer not to save until you tell it to from terminal mode. Using the latter method, the buffer empties when it fills. This buffer is also used in disk operations, so it is saved before every disk operation that uses it.

Can there be more? Yes!

DataLink provides you with twenty function keys, which let you send a string with a single keypress.

Have you ever wanted to run a program from inside your terminal program, but found that the program only gave you a few spaces to enter a command line, or made it so difficult to use the execution feature that it wasn't worth it? DataLink makes this problem a thing of the past. With one keypress from terminal mode, you can run any of ten pre-defined programs. It's that simple!

Want more? So did I, so I kept adding to the program!

From terminal mode, you can look at the date and time, set the date and time, select full and half duplex, echo mode, execute a file, load an external editor, and even access accessories!

DataLink also has a Notepad mode, which lets you make notes while you are online. You can save the notes too!

DataLink allows you to use RTS/CTS, XON/XOFF, both, or neither.

DataLink will even let you select the path where downloads go! [Note: This feature has been removed. See reason at end of file.]

S Y S T E M R E Q U I R E M E N T S

DataLink will run from a single sided floppy drive. It has been compressed using PFX Pack 1.8 (Thomas Quester) and uses about 270K of memroy (including the 32K data buffer and the 32K screen buffer) so it will easily run on a 520ST. You can un-PFX Pack DataLink with PFX Pack if you want to.

The selection of download paths was removed because I changed the way DataLink handled transfers. It now allows you to press Alt-G from

terminal mode to call XYZ, and you enter the command line. This allows you to use all the protocols, all the options, and even a different program if you want. Alt-I calls YMG, for the same reason. I think that this method will allow for greater flexabilty, even though you have to type a little.

I mention in the text file included in the archive my address (for various reasons) and I would be glad to here comments, criticisms, etc. from anyone who uses it.

A lot of people who read comp.sys.atari.st and comp.sys.atari.st.tech have offered advice on how to utilize certain parts of the ST operating system, and I would like to thank them now. They know who they are.

>BATCH mode. (Feed it a list of files to convert, and let it fly).

>DMJ GIF 2.0 produces the best conversions I've seen to date, but takes up to
>1/2 an hour to perform the conversion on a stock ST, or 17 minutes with
>AdSpeed running @ 16MHz, but that's still too slow to wait around for.

>Even if it's slower, the ability to convert overnight will provide me with
>better 'throughput'.

DMJ Gif 3.0 should be (I'm praying every night. I want it THAT BAD!)
released by the end of October or the first few weeks in November. It will
have batch mode; feed it a bunch of GIFs to convert, and a destination
path, and it will automatically convert 'em. It's supposed to offer a few
more dithering modes, a totally rewritten interface, and there's an
emphasis on flexibility of options. Really complete, thorough program.

As an aside, if you don't pay your Shareware dues for this program, you
really are the lowest form of life on the planet. It doesn't take a rocket
scientist to see that Shareware for the ST is being produced in lesser
quantities each year. By supporting what little quality stuff is being
produced (DMJ Gif is a glowing example), you are ensuring the speedy demise
of the ST. No computer is useful without continuous software support.

From: pinelr@aix.rpi.edu
Message-ID: <ptfpms_@rpi.edu>
Source record: 228141

It sounds like your "print density" control is not set right. I have a Mega 2 and when I first started doing screen dumps I had the same problem. The way to fix it is to go in to the control panel and click on the "Install Printer" option. You should get a window that has different print densities. The default is 1280, i believe, and you need to set it to 960. That should compress your screen dumps to fit on your page.

.sigless,
Rob

3659. Last TeX font question

Newsgroup: comp.sys.atari.st
Date: 1991-10-19 06:09:30 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <4970@tamsun.TAMU.EDU>
Source record: 228142

Ok, this should be my last annoying TeX question (I hope).

Lots of people has responded with good information about TeX fonts.
I need to verify this combination of the information and ask
just one more.

The ".tfm" fonts are used by TeX (and maybe Metafont). These are called
TeX font metrics.

The "pk" fonts are "raster" fonts. The number associated with them describes
the dots per inch (dpi), so "cmr10\96pk" is a 96dpi format of the computer
modern roman 10 point font.

The "flib" facility merely packs in the "pk" files into an archive. It is
faster and uses less disk space, but is only used by a few types of atari
screen previewer's and dvi printer programs.

Please comment on the accuracy of the above.

Now is the part I am still confused about.

The "flib" archives are store in files like "pk0083", "pk0100", "pk0120", and
other multiplicatiosn of 1.2. Also, when I loaded the German version of the
24pin fonts, they all were store in directories in the format of
"mag____1.200" and so on. Now my question is, since these 24pin fonts are
labeled for 360dpi, how do I place them in my font directory. Should I
put all of these in the form of "cmr10\360pk" and so on. And since "cmr10"
is repeated in Magstep 1, 1.2, 1.44, 1.72... should I just store the 1
magstep font. I was thinking of storing these fonts in an "flib" (still
need to learn how to make a flib with the flib.ttp program), because the
"dviatari" fonts are store in the form of "pk0100", "pk0120,...", but that
again brings up the questions of how I am going to let "dviprint" know
that these are 360dpi fonts.

Can someone clear up this last question. Maybe telling me how to create
a "pk" raster font would clear things up.

THANKS THANKS THANKS for all of the help so far. I think my goal now is
provide a document summarizing several peoples experiences installing and
using TeX, LaTeX, and the atari pre-view and printing programs.
(Unfortunately I lost all of my Mail logs when I hit the 300 folder limit
of foldr300.prg, so I am going by memory on much of this.)

>update from 3.0 for $45 or something. What did they update in 3.1? Is it
>worth $45 or whatever they want?

I've just received my 3.1 version, and it is very nice. What you get for the extra bucks is new manual pages to add/replace in the binder, the new 3.1 disk and and a tutorial disk, which seems very nicely done. One thing I should warn you about though, is that Alexander Publishing gave me a lot of trouble. They sent me a batch of bad disks and when I complained to them, they said they would mail out a prepaid postage box so I could have the disks replaced. Two weeks later, I called to find out where my box was and was told that I'd have to deal with C-Lab directly. So I did, and they took care of it very quickly and professionally, with the parting comment "We're gonna have to talk to those guys at Alexander Publishing."

3.1's additional features include the ability to export notation as DTP type files to be used as parts of other documents (.IMG files) plus lots of other hardware support and display options (page preview, etc.) It is worth the money, but you have to get both 3.0 and 3.1 since 3.0 comes with the new manual and the fonts disk that you'll need. My suggestion though is to order it directly from C-Lab instead of those clowns as Alexander.

C-Lab's number is: 415-738-1633 That's tech support. They can answer all of your 3.1 questions plus how/where to get it etc. Good luck with it, I'm very impressed!

.sigless,
Rob

Get a lead (Graphite) HB pencil and rub it over the earth strap that
contacts a peg on the spindle end of the drive,
they tend to get dry and squeek.

Note: You will have to lift up the earth strap spring a little to get the pencil
underneath it, but please Don't force it..

Not all drives have a spring, some use a plastic cap that is part of
the control card, you would have to remove the card to get at it, but
then that type should not squeek....

Note: this is called a Static ground strap, it earths the spindle to stop
static charges building up on the platters, they don't get a good earth

though the bearings because of the grease in them..

I don't think its posible to get a Mega STE with a bigger drive, if
you get the one with out the Drive, you have to go to Atari to get the Parts
for the drives to be fitted, but do they sell the parts with out Drive.?

There are rumours that you have to bye all the Parts from Atari..??
and that meens drive as well..

3666. Re: Atari Abaq

Newsgroup: comp.sys.atari.st
Date: 1991-10-19 13:41:32 UTC
From: ilaskey@cix.compulink.co.uk
Message-ID: <1991Oct19.134132.16953@demon.co.uk>
Source record: 227755

The abaq did indeed get to the market in the UK and Europe. I saw a very nice -
setup at one of the UK shows with the Abaq linked to a Kodak 35m scanner/colou-
r printer.
It scanned in perfect full colour pictures and allowed pretty impressive cut
and paste between different parts and pictures and then allowed a nice new
picture to printed of the result. The output couldn't be faulted as a normal 3-
5m picture.
It is now no longer sold in the UK as far as I know although I beleive it is s-
till sold in some European countires (Germany?).
The technology is still being looked at though and may re-surface at later dat-
e.Possibly as a bolt on for STs

3667. Demoes

Newsgroup: comp.sys.atari.st
Date: 1991-10-19 14:12:24 UTC
From: edb02@dhmolde.no
Message-ID: <"722*.S=edb02.O=dhmolde.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228149

OK, let's ramble a bit about these demos that cause so much trouble...

First of all a couple of words about myself. I'm the kind of guy who enjoy hacking my way through protections etc., AND I collect demos. I've got almost a hundred demodisks by now, so I know what I'm talking about... :-)

Delirius 3 (or 2.75):

This demo is STE only (forget it if you have an ST). It uses 4096 colors,DMA sound and Hardware scrolling.

Because of the WORST disk routine I've seen for ages it doesn't load properly on anything but <MegaSte machines.. This is probably due to Atari Changing some timing somewhere. The weird thing is that they use their own disk-routine while still using Gemdos(9) to write the text on screen!! Why didn't they use Xbios to load the screens when they didn't throw away the OS??

I've got it in files on my harddisk and if I can find some spare time I'll do a file version of it. But since it's really a CRAP demo, It'll probably take a while until i finish it..

Oh Crikey Wot a Scorcher!:

This is a QUALITY demo ('spose you'd kill me if I said anything else Stefan?) and it works on anything but TT's. I don't have TT access (yet) so I can only guess, but it's probably the sync protection in the boot sector that doesn't work on TT. AND any screens in the demo that relies on cycle-timing wouldn't work. There are NOT many screens in Crikey that relies on cycles though, so most screens should work on TT.

You guessed it! I've got this one in files on my harddisk as well, and I've tried some of them in 16Mhz on my Mste and they run ok. (there is absolutely NO reason to run them in 16Mhz though as they all run in 1 Vbl on 8Mhz machines) The hidden screen doesn't work with my buggy shifter though... :-(

Since the demo has been hacked to pieces by a lot of guys, there is really no reason why The Lost Boys (reading this Tim?) couldn't release a new version withouth the sync-protection.... The biggest problem is that TT's are so expensive that NO demo programmers have them (well, almost nobody..) AND no technical details are available...

Just my 5 cents worth...

PLEASE don't ask me to email any of my demos/files. I've got enough problems with the sysadm :-((and I DO NOT have FTP.)

Floppy trades could be arranged if I could get some stuff from you...

Cheers,
Torbjorn Ose <edb02@dhmolde.no> I'll be back.... (Arnold S.)

3668. MC68010 on atari ?

Newsgroup: comp.sys.atari.st
Date: 1991-10-19 15:52:00 UTC
From: Patrick_Dubbrow@ms.maus.de
Message-ID: <A26656@ms.maus.de>
Source record: 227786

ogj%tglobe2.tollpost-globe @ SUB, 14.10.91 15:04:

o>Is it possible to put a MC68010 in a Atari originally equipped
o>with a MC68000 ??

If you got TOS 1.06 or higher it IS possible. The 68010 is pin-compatible to the version of 68K used in ordinary STs (not STEs). If you say that there's no official way of having TOS >= 1.06 in an old ST: There will be an adapter which allows you to run the soon coming TOS 2.06 in STs!
BTW: If your programs are not especially optimized for the 68010 you will be dissapointed.

Bye,
Patrick

While I am asking, it might be appropriate for me to ask if DC Software
accepts credit cards (Mastercard), or does COD's. If anyone knows,
please fill me in. The reason I am posting instead of mailing is that
this is probably of interest to anyone who wants to buy DC Software
products, since it doesn't seem to be mentioned in their documentation.
Since they have a number that you can call, I would assume that they
accept credit cards (how else would you place an order) but which ones?

Is there a place where cash can be wired to them if they don't accept
Mastercard?

For sale: 1 Atari SC1224 color monitor. It's one of the older(and from what I've read and been told) better models. I haven't used it in about 7 months since I sold the CPU but it was worlast used it.

I am asking for the best reasonable offer + shipping. Reply here or by mail if interested. Or you can call me at (508)683-5348 if interested.
Thank you.

Brian

>Someone mentioned two machines Atari is/was (rumored?) to be
>working on called Panther and Jaguar. Does anyone know what
>they are or where rumored to be?
>
These are (were) supposed to be Atari's answer to the Super Nintendo.
Originally, the Panter was going to be a 16-bit game system, but
like most of Atari's new products, it never came to be. Maybe it was for
the best since last I heard, the Pnather will be a 32 bit game system with
16 million colors (pallete)!

I am using mercury to exchange mail and news with my host site and I am having a slight problem with the uux utility.

First of all Gulam uses the exclamation mark to recall the top command in the history buffer , therefore I cannot (or just don't know how to ????) use this character in the command line.

My second problem is that I would like to use uux to order my host to execute this command :

uuto file mns!madmat

which would send file on my system to user madmat (me !)

Could anybody explain me how to perform this operation ?

Many thanks in advance.

The setup you want is almost identicle the the one I have on my ST (I only have one Spectre partition though).

My second-hand Minix 1.5 works fine as long as all the minix partitions are within the the first four on the drive and I don't try to access any of the extra partitions.

Your Minix partitions will be referenced as /dev/hd2 and /dev/hd3.

3677. Multigem

Newsgroup: comp.sys.atari.st
Date: 1991-10-20 02:15:44 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991Oct20.021544.18586@noose.ecn.purdue.edu>
Source record: 227758

Hello Everyone,

An outfit called E. Arthur Brown is advertising a program for the
ST called "MultiGEM", and since I remembered it being mentioned here
on the net, I was hoping someone who knows more about it could answer some
questions I have about it.

The ad says that a GEM program opens up in its own window. But can
other programs be left running in the background? Or is it merely
a more sophisticated task switcher? And what happens if those programs
running in the background want to update their windows? And what about
TOS programs: do they open into a window, or do they run as they
usually do? And if they run as they usually do, how does one switch
to a GEM program?

The ad also says that programs appear in the Desk Accessory
Menu so you can switch between them. Does this mean that one is
limited to at most 6 programs + desk accs.?

Has anyone who uses it found any particular bugs? Can Pagestream
1.82 and Turbo C run under it? How about msh and gulam?

Since I suspect this is a topic of general interest, I think
resonses to the net are appropriate.

Thank you very much in advance,

Jim

>on the net, I was hoping someone who knows more about it could answer some
>questions I have about it.

Yep. I bought it when I got my 4-megabyte 520STe. Nice program, though I haven't really exploited it to a sickening degree yet.

>The ad says that a GEM program opens up in its own window. But can
>other programs be left running in the background? Or is it merely
>a more sophisticated task switcher?

MultiGEM multitasks programs by multitasking the AES calls, I believe. TOS and TTP programs open up in their own window, which allow them to multitask to some degree. GEM programs run in the usual windows they always do, which means your screen can get a little crowded.

It is NOT a program switcher. It does true multitasking; you can literally print a file from STeno, edit an image in Easy-Draw, and write in Word Writer ST all at the same time. Note that your CPU will slow down as a result, so don't expect to triple your productivity immediately.

>The ad also says that programs appear in the Desk Accessory
>Menu so you can switch between them. Does this mean that one is
>limited to at most 6 programs + desk accs.?

Yes. MultiDesk by CodeHead is recommended (I'm waiting for MultiDesk Deluxe right now). You can switch between programs by clicking on their window, or click on their Accessory entry to bring that task "to the front". You are also limited by GEM's "seven windows maximum" limit.

>Has anyone who uses it found any particular bugs? Can Pagestream
>1.82 and Turbo C run under it? How about msh and gulam?

The author claims that Pagestream will run under it, but I can't verify that. Most of the programs that don't run well with MultiGEM are either [a] less-than-sturdy to begin with (WordUp, many earlier ST software), or [b] don't "use GEM properly" (paint programs). The author also claims that Calamus, PageStream, WordFlair, 1st Word, LDW, and many other programs MultiGEM without problems. I've seen Touch-Up multitask without problems, so I think it's definetely a case of how well your software follows the rules.

If you find a program that gives you problems, you can configure MultiGEM to stop multitasking when that program is run; other tasks are still resident, but will stop multitasking until you exit. In a worst-case situation, you can

have MultiGEM flag you when you are running a very unreliable program, so you can reboot without MultiGEM and run it "the old-fashioned way". Other options let you specify how much memory a program will allocate, and you can also run Accessories directly from the Desktop.

You must have TOS 1.2 or later. More memory is recommended, and a CPU accelerator wouldn't hurt. I'm running with an 8MHz with TOS 1.62 and 4 megabytes, so my only minor problem is with speed.

>Since I suspect this is a topic of general interest, I think
>resonses to the net are appropriate.

As it is right now, MultiGEM is not perfect, but it's a big step in the right direction. I think this is a quality product, and I hope the author continues to do more with it.

What about the fact that new TOS releases uses one of the previous free timers in the IKBD routine. This causes several games to crash on my MEGA STE and I had to make a patch (using the old IKBD-routine) to run them. When Atari suddenly uses a timer that was "free-to-use" before things must go wrong - Why do you have to do things like that :-)

Source record: 227760

Born: Aug 1985
Died: 19 Oct 1991 3.00h

My 6 year old supra 20mb hd finally bit the dust. Totally fried... it squeeled
and came to a stop. Reformatting wouldn't help. It's dead... jim.
Questions:

1) I am confused about the interface to the atari... there are two boards
in the supra case: one is a board that connects to the atari and to a multi-pin
connector to the board which sits on top of the 3.5" 20mb drive.
What are these boards?

2) can I just buy another drive (bigger perhaps?) and connect it to the board
that connects to the atari? When I buy another drive do i also get that
board which looks like it drives the heads and motor, or do i buy that
separately?

3) does anyone have any good ideas how I can get another hd up and running
with minimal $$$?

thanks
brett maraldo

Does this Program support Zmodem Batch uploads,
I have fould that a lot of Term programs use the XYZ.TTP for file
transfers, but there is a big problem, it does not support a real
Batch mode, only a wild card mode, or all the batch files have to be in
a folder..

>have TOS 1.04 and the addresses are not the same. I tried to get it by
>testing with GfA-Basic but I had no success. I couldn't get the address
>for the font used by GEM (not GDOS!).

A few days ago I had a similar problem. Originally I used LINEA $A000 to
get the font header adresses. After this call A1 points to a structure
describing the fonts (see Atari Profibuch). Unfortunately this does not
seem to work with the vdi driver of the Crazy Dots card. So I used the
negative LINEA variables instead but encountered the same problems.
My solution which is clean because I don't need LINEA anymore: I included
the font data in my program. 8x8 and 8x16 system font need 6 KByte data
space. I think this is not too much to overcome the font problem.

Try a Quantum LPS 52 megs or 105 megs SCSI drives, the LPS105S sells
for as low as $350us.

Note: that card is the ATSCI to SCSI host adapter, you will have to
find a way to fit it to another type of drive, also there are rubber feet
stuck to the drive so that the board does not short out..

Note: 2..That board is the old version, you might have to contact Supra
to see if it will work with the Quantum Drives..

Supra now use Quantum drives, the Quantum LPS series is well suited to that
drive box as it does not have a fan..

In my case 1st_Word 3.xx doesn't work. Now I have 'downgraded' to version 2.0x to work with some old wordplus-documents.

Re: questions about SIPPs and SIMMs...

A "DIP" package is a normal integrated circuit... the kind of thing that looks like a cockroach or centepide.. it stands for "Dual In-line Package" (referring to the two rows of pins down both sides of the chip).

A "SIP" is a "Single In-line Package", or essentially a chip with only one row of pins coming out one side. This allows the chips to be mounted vertically for higher pc board density. A memory SIP is a small pc board with RAM chips on it, the board being mounted vertically on the motherboard in this same fashion. SIPs are usually *soldered* in place.

A "SIMM" is a "Single In-line Memory Module" and is similar to the memory SIP, except that it has an edge connector instead of pins, and is mounted in a socket on the motherboard, making it easy to remove and replace.

As for the speed of memory, whether DIPs, SIPs or SIMMs, the Atari ST requires RAM that is at least 150ns. ANYTHING FASTER THAN THAT IS WASTED!

The ST can only access memory just so fast.. it doesn't matter if the RAM can respond faster, the ST can't make use of the shorter access times.

The only reason to buy faster RAM is if you can find it cheaper than 150ns parts (which often happens, as 70ns parts are more commonly used in the IBM world).

I run Minix and Spectre on a hard drive with an ICD adapter and solved the 4 disk partition problem just the way you suggest, except that I've got only one Minix partition. I also have further GEM and Spectre partitions on a Megafile 30 that follows my main HD. (It might be possible to rebuild Minix to allow more than 4 partitions, but I haven't looked into this and wouldn't want to be dependent on that anyway).

3690. Re: PC DITTO I

Christopher Russell asked about pc-ditto 1..

The original software pc-ditto works just fine on a 1 Meg machine with floppies. It emulates a 640K 8088 PC XT with CGA or monochrome display.

The major drawback of course is its speed. For applications like word processing it's ok, but anything requiring fast screen updating, ie: games, is far too slow to be useful.

For the price (I *hope* Toad has it very inexpensively), it's useful for occasional forays into the MS-DOS world.

3691. Speed boasting

Newsgroup: comp.sys.atari.st
Date: 1991-10-20 19:16:31 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <4998@tamsun.TAMU.EDU>
Source record: 227771

I am rarely impressed with speed boasting. Speed is very relative to what you are doing. Sure, its fun to own a computer that is fast or that is in a family of fast computers with an upgrade option, but for the purposes that I see comp.sys.atari.st discussing a 68000 at 8Mhz and 16Mhz is fast enough.

The features that I like to boast about in a computer are:

- feel of the keyboard (It's easy to get carpul-tunnel syndrome from most key-boards, including the 1040STf)
- placement of the peripherals.
- I/O speed. Sure you can have a 5 MIPS atari, but your still going to have a bottleneck to the hard drive, modem, printer, and ethernet devices.

I think that instead of just flaunting speed as if a computer is only really great if it has a fast CPU, we should look at all the features and include speed as one of them.

Think of a car or home stereo system. Many people buy the finest radio synthesizer, equalizer, compact disc player, and then use low quality speakers. Sure the sound could sound gold, but the buyer doesn't get the sound quality that was advertised for the radio synthesizer, equalize,etc. And, then the buyer sometimes says that the manufacturer is lying to them, buy advertising a system that does make the sound they advertised, when the true fault is in the speakers.

In the same was, a person using a word processor is not getting the speed they bought if they do a lot of read/writing to a slow hard drive. Also, the person is really wasting speed unless they can read text as fast as Commander Data on Star Trek the next generation.

Please, no flames, I like computer speed, but I want to keep it in perspective. Please feel free to boast of Atari's speed in the TT040.

DataLink will allow a 78 character command line, so that is what you have to work with. In the next version, I'll add the ability to write a TOSEND.INF file so that you can use that option and then pass the TOSEND.INF to XYZ using the -1 option. That should make it a little easier. For now, though, you should probably use wilcards or as much as you can fit on the command line. If you have a better suggestion, I'll be glad to incorporate it. I don't want to tie DataLink too tightly to any transfer program, since it is designed to be able to use them all.

Message-ID: <1991Oct20.230522.20602@jade2.tufts.edu>
Source record: 227777

Hi everyone,

I ran into a problem when compiling with Sozonbon C, gulam, and make. I have a habit of writing programs that take up lots of files, to support modularity and code reusability. The problem comes when I have a lot of files, and when I link, the length of the link command with its parameters exceeds a certain number of characters (> 132 ?), then make or gulam gives me an error, saying that the line is too long.

I would like to see how you programmers deal with this problem. Is there a way to enlarge the line buffer of gulam. A short term solution, of course, would be to make libraries of collection of files. What other solutions are there?

Thanks,

Maurice

Doesn't xyz support several files on a command line? If so you could use the file elector to select files to u/l and use cancel button to signal when you have selected enough files. Keep track of the selections and pass that to xyz (or whatever zmodem prg you use)...

Hi out there. Does anyone know the address of Dave Small & co. I'd like to get some more info on the SST board. Where to order and how much etc.

Does anyone know of any thing special one should think about before buying such a beast. More importanly:

1) What exactly is included as standard components? At what price?

2) How much RAM can be added to the board? Access times? Does it use SIMM's or DIL's?

Thank you in advance.

(Does someone please try to mail me at soren@tequila.vlsi.auc.dk since I'm not sure outside post gets to me here!)

All SERIOUS users use monochrome? As soon as I get around to buying a
monitor switcher, the sooner I can stop using Gumby resolution. Medium
is so UGLY after monochrome - I spend most of my time editting source code.

Anyone got some good RGB values for minimum eye-strain in colour text modes?

Warwick.

From what I can remember, as I only had a quick play with XYZ 202 ?,
it could not do a batch upload with explicit file names.

Terminal programs must support Full ARCV, none of this 125 character
command line limit.

Uploaded files can be all over the place and in some folders deep, this
is why the 125 limit is far to short.

I get involved in uploading lots of files to BBS's, but at the
moment I am limited to 3 files per upload, I use the GSZRZ18, this is
the German Gem Zmodem program, but still only uses the command line..

This is the way I had the transfer system set up to begin with. XYZ was
required to use DataLink. I later changed my mind and removed that
aspect of the program, so that people can use any transfer utility they
want. The method you suggest would work up to a point; I don't think
that XYZ uses the ARGV standard, so it wouldn't be able to receive very
many files on a command line. It does allow you to write the files to a
file, and then use that file for input though. This should work in
theory, but I had an extremely hard time getting it to work at all. In
the next version of DataLink, I will add the ability to construct a file
that you can pass to XYZ. The feature will let you select files until
you hit cancel, and it will write them out to a file of your choice.
Then you can pass the filename to XYZ while you select your transfer
type and other options.

There is a possability of a color version, but I'm not too sure about it.
I only have a Monochrome monitor, and the RF Modulator that connects the
ST to my TV is broken for some reason. The reason DataLink will only run
in Monochrome (I tried color when I had it) is that the RSC file has
dialogs with a lot of information in them. When I was designing the
dialogs, I was intending for the program to be used on a Monochrome
display so it never occured to me to make the dialogs smaller (but more
complex). If I get the RF Modulator fixed, and if the users show enough
interest by sending in their $5, then I will work on it until there is a
color version. DataLink doesn't do anything that should cause problems
in color, except for the size of the dialogs, so it shouldn't be too hard
to get it working in color after I re-organize the dialogs.

I agree with you that color is painful on the ST. It isn't so bad on the IBM machines with Super VGA, but it still annoys me. If I could have made DataLink support color I would have, but the RF Modulator that connects my ST to my TV is broken, and I don't have a color monitor. I said in an earlier message that I would make DataLink support color if the users supported the product by sending in their $5, which will allow me to buy a RF Modulator. I want to make DataLink as good a program as I can.

3707. HD to TT ?

Newsgroup: comp.sys.atari.st
Date: 1991-10-21 10:26:11 UTC
From: luoto@cs.Helsinki.FI
Message-ID: <20156@hydra.Helsinki.FI>
Source record: 227790

As Heard from many sources, TT is supposed to be quite ready for a
HD-disk drive
, some people claim that it only need's a dip switch change etc...

but:

-are they talkin about internal / external floppy drive and more
important:

HAS ANYONE DONE IT: replaced the internal TT disk drive with a HD ?
and what are the exact procedures to make it work ? what SW is needed ?

spaziba !

>allows you to run the soon coming TOS 2.06 in STs!

Some weeks ago I've posted some information about a small hardware hack how to
adapt TOS 2.(0)5 on EPROMs to work in a MEGA ST.
The main thing was to adapt the chip select to the start address of TOS 2.05.
I think this should work on usual STs this way canonical ...

I was kinda surprised, that I got no response for the article. If anybody is
interested now, just try to grab it from a news archive. Or send me email.

Good hack,

Larry

Yes, I did it months ago. If you set dip switch #8 (or #7, I'm not quite
sure) to ON you get the option "High Density" in the desktops format
dialog. But you can select this button only with TOS 3.05 or higher.
The dip switcht is only responsible for this button to appear. High
density drives work without changing this switch. The only problem is that
some controllers don't work correctly with 16 MHz used for HD discs. But
soon there will be new floppy controllers to overcome this problem.
BTW, I use an external and an internal HD drive.

> Hi, is there a way to send email to GENIE accounts from BITNET or
> Internet and vice versa?

There is a GEnie project to build an Internet gateway, but no official gateway currently exists.

Anyone in North America can get a GEnie membership for a flat monthly fee of $4.95 U.S. or $5.95 CDN. There is no additional charge for email, and most non-computer-related roundtables are included in the basic fee. There also is no telecommunications charge if you dial into a GE network port. There are GE ports in most major cities.

3713. TeX and LaTeX document

Newsgroup: comp.sys.atari.st
Date: 1991-10-21 15:27:34 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <5026@tamsun.TAMU.EDU>
Source record: 227794

No more nasty TeX questions. I have it installed and working now.
I will make a document containig:

- Atari ST TeX experiences from the USENET
- Configuring the ST TeX software for the 1st time
- The font conventions
- Making a "format" file
- Creating a working "TeX" and "LaTeX" system
- Using "dvieps" for EPSON 9-pin output
- Using "dviatari" for screen output
- Using "showdvi" for screen output
- Using "dviprint" for EPSON 9-pin or 24-pin printers
- Getting 24 pin fonts

I need a few volunteers to help proof read this document and to give
me additional advice on the following topics:

- Getting fonts for laser printers (SLM, HP, etc)
- Creating "pk" fonts.
- Using TeX on a 1Mg machine witout a shell language like Gulam.

Please send me E-mail for requests. The document (1st draft) should be
available around November 5th. (Maybe much earlier).

Mark Lehmann

What I would like to know two along this same thread is anyone has
bought and installed a HD in thier MEGA STE?

If So, what kind did you get? And, how did you mount it?

My drive is GLUED to the cover panel. Why? because they had
a glue fight at the factory that day, and thought it would be
a neat joke to play on a fellow Atari customer.

Allan Pratt writes:

Thank you for the opportunity to discuss the question "why doesn't program X work on machine Y?"

Program X might have been written by real dingbats, that's why.

... [stuff deleted]

My point is that we just can't fix these things. I don't like the fact that Starglider doesn't work under new TOS, but I can't help it.

That reminds me...

Has Atari ever considered releasing the 'classic' versions of the ROM on floppy? It would be quite useful for people who *love* Star Raiders but have brand new Mega4/Ste's (I'm now reduced to playing the 2600 version of SR :-().

I understand that Atari might not want to release 1.6, 2.??, 3.??, or even 1.4 on floppy because Atari also sell ROMs for those. But how about 1.0 and/or 1.2? As a developer, it would be useful for making *sure* my software is backwards compatible, not to mention running older software for the other folks out there.

Now barring the possibility of people using these disks for hacking, virus propagation, and even (*gasp*) Atari emulators, please keep in mind, that in the "real-world" (tm) :

o Almost all other platforms have OS upgrades/releases on loadable media even if they have some OS in ROM.

o Viruses get spread quite nicely despite the TOS being in ROM. This is the case for most computers anyway :-(Having TOS on floppy wouldn't change this or even exacerbate the problem. It would, however, provide a benchmark to compare versions of OS against.

o People have already been putting the ROMs on floppy in order to make sure they can always run all their software.

o Patched versions of the OS have legitimate uses and anyone using such a version should expect the unexpected. Having the OS in ROM hasn't stopped anyone from making their own EPROMS with patches.

I'll step off my soap-box now. Next. :-)

On another point, has Atari ever considered re-releasing the classic ST games for the newer generation machines (ie Star Raiders)?

Grins,

Joe

3716. Re: Why programs don't work (was Fligth Simulator on STe)

Newsgroup: comp.sys.atari.st
Date: 1991-10-21 17:17:08 UTC
From: apratt@atari.UUCP
Message-ID: <3108@atari.UUCP>
Source record: 227712

In mail to me, Lars-Erik Osterud remarks that some games didn't work under some TOSes because TOS uses Timer A, which is "reserved for applications."

What happened is that TOS used that timer DURING BOOT, which is perfectly reasonable. After the boot sequence, it does not use that timer. However, it left the timer and its interrupt channel in a state other than the reset state. If the game programmer had not made assumptions about the state of that timer, the game would have worked.

The same thing would happen if you ran some other program before the game, using old TOS, and that program used Timer A (legally) but left it in a state other than the reset state. Correct programs do not assume anything about a resource like this, and approach it carefully. Incorrect programs might, for example, unmask the interrupt before they install the vector, because they think it's not enabled or the timer isn't running.

The newest TOS leaves that timer in the same state it boots up in: with the interrupt disabled and the timer stopped. This is an example of the other kind of pain we go through in the name of compatibility: we even try to make badly-written programs continue to work.

Finally, for everybody: any time you refer to "some programs" not working, PLEASE name the programs, so we can check out the reasons here. We run new TOSes on our library, but we don't have all programs in the library, and we don't try them in all ways. If you can name a program that doesn't work, we want to hear it so we can investigate. If it doesn't just bomb on start-up or something, then explain how to make it fail.

>the money, but you have to get both 3.0 and 3.1 since 3.0 comes with the new
>manual and the fonts disk that you'll need.

In the UK there are two upgrade prices - #60 for 2.x->3.1 and #20 for
3.0->3.1. Both are good value (I got 3.0) as well.

For my 2p-worth, the biggest improvements in 3.1 are:

Page preview (MUCH better - you can do things like alter the horizontal
spacing and margins directly, as well as look at the bottoms of large
pages)

Grace notes and "free" notes.
Ability to have n-tuplet figures up or down (and a separate font for
them).

Quite a few other minor goodies.

What C-Lab crow most about is the graphic arrange mode, which is indeed
nice. There's also a Fostex-sync mode.

Doesn't seem to be much larger, though 1MB would be pretty tight
nowadays.

Ian

Oh my, why do people insist on making life difficult for themselves?

Why don't you simply use CS-TeX, available from several atari servers via ftp.
This program sets up EVERYTHING, the INSTALL.PRG builds all the right files,
directories etc.

There's a TeX shell that makes document recompilation a 3-key issue.
There's an automated Metafont that makes all fonts for your output device(s)
automatically, either on the fly as you need them, or as an overnight job.

Naturally, there's a previewer included that works with printer fonts, to
save on disk space. And of course there's a Panasonic printer driver.

FOLDR750 is outrageous! Needless to say, CS-TeX runs fine on TOS < 1.4 with
FOLDR090 or so. I don't use FOLDRxxx at all (TOS 1.4) and never had any
trouble running it.

Hya!

First, thank your for your quick answer. But the problem, I have, is where to poke the font address to. In my programs I user my own fonts, too. But I wrote them with TOS 1.02. Now, after I installed TOS 1.04, texts aren't displayed with MY fonts when I use the GfA-Basic TEXT command. Using TOS 1.02, the address was $8820, but now?! The TOS font address (the address where to poke the font location to) is still SUB(L~A, 22).

>by 1989. I even saw a picture of the Atari Abaq in an atari magazine.

Hehe...Um, tell your friend to lay off the bong for a few minutes before
he starts talking about computers next time. :-)

>Do anyone have the scoop on this?

I don't know the exact number of Abaq transputer machines that were made,
but I am under the impression that the number is in the low hundreds at
best. It ran a new somewhat-buggy OS that supported parallel processing
and is used in a few universities in Europe.

They probably never sold enough of them to even cover a fraction of the
R&D cost.

Skoal,

Chris

Actually you can use HD disks on TOS 2.05 too (on the MEGA STE)
You have to move a DIP here to (6 or 7) but I haven't found a HD-drive
that fits (you must be able to move over the front and the button).

>> Bob Malay

>Megafile 30 that follows my main HD. (It might be possible to rebuild
>Minix to allow more than 4 partitions, but I haven't looked into this and
>wouldn't want to be dependent on that anyway).

(I already replied to Bob Malay about this in more detail....)
Does anybody who uses ST Minix read this newsgroup (anymore) ? Frans
Meulenbroeks (who's name is on the COVER of the ST Minix vers. 1.5
manual) I know shows up occasionally. anyone else ?

What to do if you want to use partitions BEYOND /dev/hd4 on ST Minix
1.5 from Prentis-Hall ? Well..... you have to upgrade(=patch) Minix
from version 1.5.10.0 (the version SHIPPED by Prentis-Hall) to at
least version 1.5.10.3 and recompile the thing..... Yes, it DOES
work!!! The patches are available somewhere on plains.nodak.edu for
anonymous ftp.
Now, if you want to be able to use MORE than 5 partitions at one time
(Which is a different matter than using partitions out beyond
/dev/hd4) you'll have to change a #define somewhere. Since I haven't
done it I don't remember where it is..... 4 partitons is more than
enough for my purposes.

There is a newsgroup where people are only too happy to help out with
minix questions.....
comp.os.minix
There's EVEN a FAQ.... :-).

It's worth pointing out that the flat monthly fee only applies if you call
after 6pm, before 6am, or on weekends. Otherwise all services are $18/hour
(ouch!) or $24/hour for 9600 baud (Double ouch!).

Alxe Kieran mentioned on GEnie recently that Hisoft is
updating their Lattice C compiler soon. It is supposed
to have an intergrated project management (aka MAKE).
there is also supposed to be a new "ToolPac" which
will contain many UNIX tools for the LC5 package.

Now, could someone in the UK ask Hisoft about this update?
And about the ToolPac?

I am on Hisoft's mailing list but who knows?

>nine lives. (or more if it's been upgraded :-)

Not a bad idea. By the way, one use of multiple sectors on the same track
is copy protection. This is an ancient (and not very effective) method. The
program repeatedly reads that sector number, head slop will allow the drive to
read the second one, and the program proceeds. File oriented disk copies
will not pick up both sectors (although any low level copy program probably
will).

Up to now I thought in TOS 2.0 Timer A is used for floppy timing. (In TOS 3.0
this is done with Timer C of the second MFP.) If Timer A is not used for
floppy timing on the MegaSTE I'd like to know how processor independent
floppy timing is achieved on these machines.

Message-ID: <1991Oct22.094215.22164@ugle.unit.no>
Source record: 227715

Yes, I did it.
And here is what to do:
1) Take out the old (720k) drive.
2) Put in the new one.
3) It works.

Allthough this works, I wouldn't recommend doing it, since the WD1772-chip isn't supposed to be able to cope with 16 Mhz. Wait for the new chip from atari !!

Note: You have to have your own software to FORMAT HD-disks, but TOS will automagically read/write HD/normal disks. If you have source to a floppy-formatter, just change number of sectors to 18 instead of 9 and recompile. You will then have a HD-formatter.
Also if you have Tos >= 3.05, you can set a DIP-switch so that you may format HD-disks from the desktop.

3737. sozobon C and SUN

Newsgroup: comp.sys.atari.st
Date: 1991-10-22 11:30:20 UTC
From: robin@castle.ed.ac.uk
Message-ID: <14000@castle.ed.ac.uk>
Source record: 227728

I have been trying to build the sozobon C compiler on a SUN 4 using the sozosun.zoo diffs on terminator (aka atari.archive). Most of it compiles except for hcc.ttp, the block pre.c cannot find some externs:--

```
_curstr
_nxttok
_sawnl
_chr_push
_curtok
_tk_flags
```

Where are these? The Makefile also has in the OBJS tok.o, there is no tok.c but there is a tok.h which is included with #include "tok.h" in many of the .c blocks. So I removed the tok.o from the $(OBJS) and only the above errors show.

Can anyone help me?

Thanks

Robin

The same sort of thing applies here in New Zealand,
but you pay a connect charge of $8us per hour, but no charge for
uploading files, but you pay for all other times,
but no line charges even from here..

This is a ME TOO !

I have the same problem with games. Atari should forget about tricky people sparing a few dollars for the ROM's by using a disk. You loose a lot of memory and the ROM's are much more comfortable, if something went's wrong.

They should place an Atari Emulator for PC's on the market, showing that emulating a little, outdated 68000 is a very hard job for those super, duper 80486's. May be the users like the ST-software and then buy a ST for using it ...

3746. GFA RAYTRACE USERS!

Newsgroup: comp.sys.atari.st
Date: 1991-10-22 15:22:11 UTC
From: Nick.Smith@tdkt.kksys.mn.org
Message-ID: <688171659.0@tdkt.kksys.mn>
Source record: 227738

WHY A GFA RAYTRACE USER GROUP?

As an avid Raytrace user, I am interested in contacting other users, sharing operational tips, and seeing some of the creations others have been able to produce with the program. I feel that by forming an informal sort of User Group, we can all benefit from each other's experience and get the most out of our purchase.

My primary motivation however is to find other Raytrace users to join a grassroots campaign to get GFA to produce a converter for Raytrace pics, so we are not permanently trapped in Raytrace's native format.

Finally, it is my hope to build a Community Library showcasing the talents of Raytrace users, and making it availiable to anyone who is interested enough to send in a disk of thier work to contribute to the library. An informal User Group indeed! There is no cash of any sort involved here. All that will be required is a floppy disk of your Raytraced creations to get on the mailing list.

CONVERSION UTILITY NEEDED!!!

My main reason for organizing this group is to get people putting pressure on GFA Germany to release a pic conversion utility for Raytace users. Ideally, one that converts .SUL/.SCL files to Spectrum 512 format is much needed and long overdue. However, a well written 16 color converter might be a simpler alternative. A utility called SPU2DEG.TTP included with Spectrum 512 does a fairly good job of analyzing a 512 Spectrum pic and reducing it to 16 colors. Either or both are needed. And if GFA can't produce such a program they should at least be encouraged to provide enough detailed info on Raytrace file format to the public domain so that one could be written.

THE DISK LIBRARY

The 'cost' of subscribing to this newsletter is a disk, single or double sided with some examples of scenes you've created in Raytrace. We all know that there's alot of trial and error in creating a scene. But once in awhile you get the objects, the lights just right and its worth saving. Whether its some Wireframe data, or a 10 frame full-blown animation, rendered screens, or Spectrum, Neo, or other pics you use for ground, sky or texture maps, put them on a disk with your name and address. You be put on the list for the newsletter and get your disk back filled with the best works of other Raytrace users. Your 'subscription fee' becomes part of the library, and the best of the library will be mailed back to you promptly.

HOW TO GET YOUR NEWSLETTER

> BINGO, I get more fonts in, but then
> TEX stops building LaTeX will another font.

It seems that initex misses
lcircle10
lcirclew10
or
circle10
circlew10

These fonts are the same (with different names):
lcircle10 == circle10
lcirclew10 == circlew10

You can do three things:
- edit `lfonts.tex' and add/delete the `l' or
- rename the tfm and pk files or
- copy the tfm and pk files (or create links if available)

(I recommend the last, because there are many dvi-files with references
to circleXX and lcircleXX.)

> Well if you have brought 1st_Word Plus, you can upgrade to version
> 3.15, this I have read is the TT version, should work for the Mega STE..??

In the UK the explicitly TT-compatible version is 3.20TT. Yes, it actually says '3.20TT' in a dialog box that appears briefly during the startup sequence.

However, it might be the case that other version numbers are used in other countries.

Interested people might try mailing sproducts@compulink.co.uk - the ID of GST Software Products, who write Wordplus (and who are about to release Timeworks Publisher 2 soon, but that's another story).

Currently, the 'sproducts' mail addressed is being looked after by a man called Simon Jones. I don't know whether he can, or is willing to, mail to people external to the CIX (Compulink Information Exchange) conferencing system.

Hi! I'm here. I usually glance through this group and read comp.os.minix
to great detail (assuming our news feed works).

>from version 1.5.10.0 (the version SHIPPED by Prentis-Hall) to at
>least version 1.5.10.3 and recompile the thing..... Yes, it DOES
>work!!! The patches are available somewhere on plains.nodak.edu for
>anonymous ftp.

The latest version is 1.5.10.4. I posted this one several months ago.
I assume these diffs are also at plains. However they do not apply
as smoothly as [1-3] do.

>Now, if you want to be able to use MORE than 5 partitions at one time
>(Which is a different matter than using partitions out beyond
>/dev/hd4) you'll have to change a #define somewhere. Since I haven't
>done it I don't remember where it is..... 4 partitons is more than
>enough for my purposes.

NR_SUPERS
it is defined in fs/const.h or so. Mine is set to 7 instead of 5.
(but then again I also have 3 hard disks connected).
Note that if you want to connect more than 1 hard disk you definitely
need to upgrade to 1.5.10.3.

Enjoy,

>
> What has happen to ST-User, no sign of it here for some months,
> and this is for air-mail ordered copies..

It's actually not doing too badly, for a change. The mag was revamped for the October issue, taking on board some of the features of the late, lamented ST World. The current (November) issue contains possibly their best cover disk for some time, including a working (except for 'save') demo version of Avant Vector.

The tone of the mag is much less juvenile than it was a few months ago. Games coverage is still, of course, present, but it's mostly confined to its own special section, which can be pulled out.

ST User now has IDs on several online systems, including CompuServe. I can't remember that one, but an alternative is stuser@compulink.co.uk

From: bobhays@spss.com
Message-ID: <1991Oct22.173914.5681@spss.com>
Source record: 227740

You have gulam, so you have a *shell*, a thingie that interprets commands.

Now, you want some utilities - go to atari.archive.umich.edu and find the unixtkit.arc (or is that .lzh) file - this is the basic UNIX utility set ready for use in gulam. Copy the desired .TTP files (renamed from .PRG) for your desired utilities to the bin directory (where your other binaries for gulam are).

If you want C, you should go to the programming subdir of atari.archive and seek out the sozobon C stuff.

This is what I did to put together a programming environment (cheap) for my Atari. I added the GEMfast libraries so that I could work on a sample editor for my old, lame-duck S612 sampler from AKAI (again, cheap).

I have my environment (get this) on one DS/DD disk that I boot. I suggest you get a make utility if you want to do serious C development and a clock for your Atari (unless it already has one).

That should be all you need to do what you want.

Have fun! - Bob

MF>
MF> Are you sure? I tought it was the MMU that caused the 4Mb limit, but
MF> the I'm not too well educated in these matters..

If it was only the MMU it would be easy to fix. The 68000 uses the higher bits
for it's interrupt-addressing to the MFP. You have to use a sort of selector
wich divides the two addressing-destinations (the MFP and you 4+ meg banks).

>Underfunded OAPs turn to a life of crime in the great cucumber roberies of 1989
>

Chris,
Your best bet is to insert a bootable floppy into your drive
and turn your hard disk and ST on at the same time. The hard disk
will not boot for at least 15 seconds, but in the meantime, your
floppy will. At that point you should have some sort of desktop.
The only procedure left is to run your harddisk's driver. This
procedure should allow you access to your auto folder so that you
may delete the offending program.

Hallo,

seit heute habe ich mit meinem P6 PLUS ein kleines Problem.
Beim Erstellen eines Druckertreibers fielen mir seltsame
weisse Linien auf. Nach langem Suchen sah ich ,dass im Druckkopf
eine Nadel fehlt oder abgebrochen ist :(. Es ist die unterste, was
beim Textausdruck nicht stoert, umso mehr aber bei Grafik.
Deshalb meine Frage:

- Hat jemand das gleiche Problem schon gehabt, und wie gegebenenfalls
geloest?
- Kennt jemand Firmen, die Nadeln in Druckkoepfe einsetzen?
Bis jetzt konnte ich nur eine finden, die dafuer 210,- DM will.
- Kann man, falls ich die Nadel doch noch finde, diese einfach wieder
einsetzen?
- Wer schenkt mir seinen Druckkopf(Ha Ha) oder hat einen P6 PLUS zum
Ausschlachten zu verkaufen?

Fuer jede Hilfe dankbar,

Christian.

3759. How to copy screen display using fortran?

Newsgroup: comp.sys.atari.st
Date: 1991-10-22 20:00:21 UTC
From: bscott@carl.pppl.gov
Message-ID: <1041@carl.pppl.gov>
Source record: 227736

Hello all,
I use the Absoft FORTRAN quite heavily from time to time.
I would like to be able to find the 32kbytes (right?) which contain the
data for the monochrome screen in memory, and copy them elsewhere from
a FORTRAN program. Is this possible at all? I've never seen info like
this anywhere, but I'm sure this is a FAQ to someone in the know.

Specific definition of problem:
(a) I have drawn curves to the screen using the appropriate AES call.
(b) Copy screen data, byte-for-byte, from RAM into a program-defined array
(this could also be bit-for-bit)
Thanks in advance, e-mail or post.

I have two small problems with my MEGA STE and wondered if anyone (Allan ?)
could give me a hint what I should do:

- If I have several windows open on the desktop and start a program I
sometimes get the message "Out of Memory" (or something like that).
When the program is ended the last opened window/folder is closed.
This is irritating (happend with only 2 windows open sometimes).

- I have run out of room in the newdesk.inf file
I have lots of icons on the desktop, icons for files, files installed
with doc-types, and all together it it more that 126 lines.
But for some STUPID reason 126 lines seems to be the max-limit for
the newdesk.inf file. A patch gives more lines would be great !!!!

>I have always used the good old Atari black joysticks. They work well, are
>durable, and are *cheap*. ;) By the way, I have a 1040ST.

YUCK! I went through 4 sets of Atari joysticks before I bought myself a pair
of WICO joysticks. That was 8 years ago, and the WICOs still work perfectly!
Atari joysticks (and most others) use weak little shell switches, and all
soft plastic components - WICO use strong reed switches, hard plastic and
metal components! Sure, they cost more, but in $/year they are by far the
most economical!

My 2 yen worth, (That's the othe thing: I think WICO are "Made in the USA")

I have a Quantum LPS105 working with an (old) ICD host adapter.

I vaguely remember someone on GEnie (perhaps Tom Harker) saying that the old ICD host adapter (not the new Advantage series) had problems daisy-chaining some drives, either just Seagate SCSI with any other SCSI or all SCSI drives. Perhaps you might want to call ICD (talk to Howard, or maybe even Tom and mention what I said) and see what they say. That is, if you have the old host adapter. If you have the new ones, try rearranging the position of the drives on the SCSI chain. What kind of ST do you have, BTW?

>First, I'd like to say I have nothing against Mr Fordyce.

Likewise, I have nothing against Mr Lockwood (other than this posting). I to email him about this, but I have not heard back from him.

>Creative Microsystems Inc. went under because of these boards for a reason.

CMI didn't go under because of these boards. I happen to know that their Atari sales were disappointing, but isn't why they went under.

>If you install one of these boards in your machine, it may not work properly.

That's always true of any product. But I happen to know that there are at least a hundred people who successfully installed these board and are happily using them. I have personally installed them in about a dozen ST's and they all worked fine. I got mail from a satisfied user just recently who wanted the schematics for prosperity. And I've even been contacted by dealers who had good luck with them and thought they were a good product.

I don't think it is difficult, but apparently many people have trouble installing this product. Almost all of the problems I've seen have been related to installation. The only other problem I've seen is related to the PLCC sockets in the ST. The contacts corrode and if it gets bad enough the ST can stop working even without the Accelerator, but the problem is more noticeable with the Accelerator. Reseating the chips usually fixes that problem.

>I bought one of these for my 1040ST when they first came out. It installed
>OK, and seemed to work, but it interfered with the operation of the hard
>disk causing UNDETECTABLE WRITE ERRORS. I only learned this after trashing

>I didn't test it thoroughly. I removed it and sent it back...I never got
>either a fixed board or my money. I later got another board from CMI's
>successor, and it too failed to work. I used it for parts.

I'm sorry about how CMI treated Mr Lockwood, but that isn't my fault and I can't do anything about it. My guess is that he had the chip seating problem I mentioned above, or he got an early board that didn't have the mods these boards have. In any case, these boards have no inherent design flaw like Mr Lockwood says.

3766. Data Diet type programs & Random access

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 02:13:21 UTC
From: warwick@cs.uq.oz.au
Message-ID: <4662@uqcspe.cs.uq.oz.au>
Source record: 227743

Data Diet compress files transparently, right?

How [well] does it cope with random accesses to a file? For example, if I Fseek 15000 bytes into the file, how does D.D. cope? I'm lost, and very sceptical about these Data Diet tools. Also, I had a head crash on my hard disk, but I was able to restore a large number of ASCII source files by dumping tracks from the HD and manually sorting them out. Had they been compressed, all would have been lost. Secondly, my main reason for a hard disk is speed. I can buy a disk five time the size, but not one five times as fast. How much slower is Data Diet?

3767. Atari Support

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 03:12:02 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Oct23.031202.28141@actrix.gen.nz>
Source record: 227742

Well I have just seen a New product for the teaching
of Piano Playing called 'Miracle'.

This is a Large Keyboard, it also has Midi Support,
and connects to your computer/games console thought
the Joystick port.

It looks like its a USA product as one of the manuals that
I had a chance to look at, had the Software Toolworks name on it.

But now the crunch comes, NO Support for Atari Computers,
it has support for PC's, Amiga and Nintendo, but that is
again a funny thing none of those systems have built in
Midi..

So why has the USA droped Atari, is it no longer considered
a machine for music use, and do they no longer sell them
in music shops over there .?

3768. Re: ppm / pgm

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 09:56:27 UTC
From: sanchez@irisa.fr
Message-ID: <1991Oct23.095627.2601@irisa.fr>
Source record: 227901

In article <22824@mentor.cc.purdue.edu>, youngmw@sage.cc.purdue.edu (Michael) writes:
|>
|> Does anyone know the file formats for ppm's and pgm's.
|> I know it is a simple one, but nonetheless, I do not know it.
|>
Here are the mans for ppm and pgm format

ppm(5) FILE FORMATS ppm(5)

NAME
ppm - portable pixmap file format

DESCRIPTION
The portable pixmap format is a lowest common denominator
color image file format. The definition is as follows:

- A "magic number" for identifying the file type. A ppm
file's magic number is the two characters "P3".

- Whitespace (blanks, TABs, CRs, LFs).

- A width, formatted as ASCII characters in decimal.

- Whitespace.

- A height, again in ASCII decimal.

- Whitespace.

- The maximum color-component value, again in ASCII decimal.

- Whitespace.

- Width * height pixels, each three ASCII decimal values
between 0 and the specified maximum value, starting at the
top-left corner of the pixmap, proceeding in normal
English reading order. The three values for each pixel
represent red, green, and blue, respectively; a value of 0
means that color is off, and the maximum value means that
color is maxxed out.

- Characters from a "#" to the next end-of-line are ignored
(comments).

- No line should be longer than 70 characters.

Here is an example of a small pixmap in this format:
P3
feep.ppm

```
4 4
15
0 0 0 0 0 0 0 0 0 15 0 15
0 0 0 0 15 7 0 0 0 0 0 0
0 0 0 0 0 0 0 15 7 0 0 0
15 0 15 0 0 0 0 0 0 0 0 0
```

Programs that read this format should be as lenient as possible, accepting anything that looks remotely like a pixmap.

There is also a variant on the format, available by setting the RAWBITS option at compile time. This variant is

different in the following ways:

- The "magic number" is "P6" instead of "P3".

- The pixel values are stored as plain bytes, instead of ASCII decimal.

- Whitespace is not allowed in the pixels area, and only a single character of whitespace (typically a newline) is allowed after the maxval.

- The files are smaller and many times faster to read and write.

Note that this raw format can only be used for maxvals less than or equal to 255. If you use the _p_p_m library and try to write a file with a larger maxval, it will automatically fall back on the slower but more general plain format.

NAME
pgm - portable graymap file format

DESCRIPTION
The portable graymap format is a lowest common denominator grayscale file format. The definition is as follows:

- A "magic number" for identifying the file type. A pgm file's magic number is the two characters "P2".

- Whitespace (blanks, TABs, CRs, LFs).

- A width, formatted as ASCII characters in decimal.

- Whitespace.

- A height, again in ASCII decimal.

- Whitespace.

- The maximum gray value, again in ASCII decimal.

- Whitespace.

- Width * height gray values, each in ASCII decimal, between 0 and the specified maximum value, separated by whitespace, starting at the top-left corner of the graymap, proceeding in normal English reading order. A value of 0 means black, and the maximum value means white.

- Characters from a "#" to the next end-of-line are ignored (comments).

- No line should be longer than 70 characters.

Here is an example of a small graymap in this format:

```
P2
# feep.pgm
24 7
15
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
0 3 3 3 3 0 0 7 7 7 7 0 0 11 11 11 11 0 0 15 15 15 15 0
0 3 0 0 0 0 0 7 0 0 0 0 0 11 0 0 0 0 0 15 0 0 15 0
0 3 3 3 0 0 0 7 7 7 0 0 0 11 11 11 0 0 0 15 15 15 15 0
0 3 0 0 0 0 0 7 0 0 0 0 0 11 0 0 0 0 0 15 0 0 0 0
0 3 0 0 0 0 0 7 7 7 7 0 0 11 11 11 11 0 0 15 0 0 0 0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
```

Programs that read this format should be as lenient as possible, accepting anything that looks remotely like a graymap.

Sun Release 4.1 Last change: 27 September 1991 1

pgm(5) FILE FORMATS pgm(5)

There is also a variant on the format, available by setting the RAWBITS option at compile time. This variant is different in the following ways:

- The "magic number" is "P5" instead of "P2".

- The gray values are stored as plain bytes, instead of ASCII decimal.

- No whitespace is allowed in the grays section, and only a single character of whitespace (typically a newline) is allowed after the maxval.

- The files are smaller and many times faster to read and write.

Note that this raw format can only be used for maxvals less than or equal to 255. If you use the _p_g_m library and try to write a file with a larger maxval, it will automatically fall back on the slower but more general plain format.

I have just recently received a demo of Calligrapher Professional
and I am very impressed by the features list. However, before I
commit myself to buying it, I would like some further opinions/
reviews. I would particularly like to know how reliable it
is (ie are there any bugs?), how good the support has been, how fast
it prints, how good is the print quality etc.

3770. How can event-multi return event when...

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 10:28:20 UTC
From: r0mill01@ULKYVX.BITNET
Message-ID: <1991Oct23.102820.20079@vlsi.louisville.edu>
Source record: 227907

I have an application that uses the AES (and the VDI only a little). But after I init the application, and open a full-screen workstation, I don't open any AES windows. I just use the whole screen. The user can choose to have the AES read the keyboard, TOS, or GEMDOS. OK, when I use the AES, a mouse click can call a macro which does something the user wants (actually any AES event can have a macro). If no macros are defined, the default is for one left click to reposition the cursor where the mouse is. This works fine, exceptwhen the mouse is on the top line of the screen (just below the border). When the user has menus up the top line is AES controlled so that's not an issue, but when menus are not being displayed (I use menubar to turn them on or off), no mouse event within the TOP line causes an event_multi return. If you click while the mouse is in that line, nothing happens, but as soon as you move the mouse out of the row, event_multi returns a M_CLICK|M_MOVE event. This cositions the cursor on the second line exactly where the mouse entered the second line.

Is there a way to use the AES and event_multi to get a click event WHILE the mouse is in that TOP line?

Uniterm can do it, but perhaps Simon has bypassed the AES in favor of LINEA or something. I really want this to be only AES calls for mouse/key/message events. Just a thought, what if I set the timer event interval real low 0 or 1. Would evnt_multi return mouse_button_click when the timer ran out (assuming the button had been(clicked)? And if so, would the m_X, m_y parameters be properly filled?

Thanks for your time and patience

This is of great interest to me. I just purchased DC Data Diet on Monday, and am waiting for it in the mail. Are you saying that the crash you had was *because* of DC Data Diet, or was it unrelated? The way I understand the workings of DC Data Diet, you should be able to fseek into a file easily. Whenever a compressed files is read, it creates a duplicate of the file in a work directory and all operations on the file are done on the duplicate. Then when the file is closed, it is copied back to the original spot. DC Data Diet will only slow you down if you want to compress the files as you use them. It is supposed to have a mode that will compress the files when the current application terminates. Please tell me more about your crash, though. I also have a questions about Hard Drives:

1. Should the Atari Megafile 30 make a "chirping, or beeping, or squeking, or creaking" kind of sound when it writes to the drive? The sound is kind of hard to describe! :=(The drive made this sound from the beginning, and it worries me now as much as it did then. There has to be someone else who owns a MegaFile or has heard the sound before...

My last question has to do with power surges. Today my hard drive was running fine and then it suddenly started running FAST! The fan started whirring *REAL* fast, and I turned it off right away. Could this have been a power surge? It has never happened before, and my power bar

claims to have a surge supressor (but not eliminator?).

Thanks in advance...

I think Mercury's uux is broken. It doesn't pass any command switches
to the remote program. It definately doesn't allow redirection to tell
a file to be sent accompaying the uux output file.
Has anyone fixed this? If so, I'd sure like a copy.

I've read in a couple of magazines (ST Informer, Atari Explorer...)
that the Panther was going to be a 16bit games console, but
development on the Jaguar was going so well that Atari decided to put
all of its resources into building the more powerful 32bit Jaguar
machines.

* PLEASE RESPOND VIA E-MAIL, I like to read this group but frequently
* fall behind. I need help with this long before I will get all caught
* up. Thanks...

I am looking for a program to copy files from the A: to a RamDrive at
Boottime. I have tried AUTOCOPY and TPORT. Both of these programs
have been giving me problems copying files.

TPORT just out and out doesn't seem to work on the STE!!!

AUTOCOPY works fine for progs in the ROOT dir, but chokes and gags at
trying to copy an ENTIRE directory.

3777. Railroad Tycoon

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 17:48:22 UTC
From: bill@mwca.UUCP
Message-ID: <1929@mwca.UUCP>
Source record: 227939

So now that some people have had a chance to play Railroad Tycoon for a few weeks, how is it (other than the installation bugs)? I bought it recently, but haven't had time to do much other than install it. It seems to run fine, other than the install program having the misnamed file, which can be fixed by simply doing a copy of both floppies to the hard disk.

Has anyone seen bugs during game play? Does it seem up to par versus the PC version?

3778. Need help unsplitting files

Newsgroup: comp.sys.atari.st
Date: 1991-10-23 19:32:35 UTC
From: odonnj@rs6217.ecs.rpi.edu
Message-ID: <j=lp+yj@rpi.edu>
Source record: 227942

What is the best way to get a large binary file (greater than the size of one floppy) from the IBM RS6000 workstation (that I ftp from) to my ST? I have Mtools on the IBM so I can get stuff on to a disk, but how do I split up the files so that I can get them onto more than one disk and then how do I rejoin them on my ST?

The file I am specifically trying to get right now is 'bin.zoo' (containing the gcc binaries) from atari.archive. I can use the AIX command (or maybe it's a 'bash' command, I don't know) 'split' to split the file up into smaller chunks (which when rejoined via 'cat' on the IBM are identical to the original), but how do I do rejoin them on the ST? I've tried the 'cat' from gulam and from Micro C-Tools and neither worked. I could un-zoo the archive and re-zoo it in smaller pieces, but we don't have Zoo v2.1 on the computer, and I am not up to building it.

Any help would be appreciated...

Why don't you set your commands in qoutes. For example:

uucp 'myfile malihh!mcshh!unido!uunet!yourfile'

this will completely hand over the whole string in the qoutes to 'uucp'.

>My second problem is that I would like to use uux to order my host to
>execute this command :

For this work, I would really recommend the HERMES package. Since now, all
doc's are written in german, but perhaps I could get the Author to
translate them to english. Then we could mail that stuff to Jeff Weiner
for putting it on atari.archive. The archive now has about 640kB and
installation is as hard as mercury, but that work will definitely be
payed by more comfort.

Bye......Michael

>is this abaq the same thing as something called "ATW" -transputer
>station made by atari in 80'ies too ?
>
>and is this "parallel supporting OC" same thing as "helios" used in ATW

Yes, and yes. Abaq turned out to be a name used by someone somewhere
else, so the name was changed to ATW. Helios was a Uni*-like os with
parallelism designed into it. It sounded like it might be a hapeening
system, but reveiws I read of the implementation, and conversations
with someone developing for Helios suggest it was (is) a bit of a kludge.
Also, the hacking in of a Mega as a front end i/o system appearantly
is a major bottleneck.
From a hardware point of view, the parallel concept is still very viable
for array-processing intensive applications like graphics. Imagine a ray
tracing program which can assign each ray trace to a seperate processor,
and the idea starts to look good.
Kodak appearantly has one at Ontario Place in Toronto that does some
slide to computer conversions(or is it computer to slide?) that are
very impressive.
The marketing, as usual, doesn't seem to have been very effective,
though I beleive the US Atari refused to even try to market it. The UK
Atari people were at some North American graphics shows, showing it
off. There was one at the Vancouver Atari Fest here last spring, but no
one seemed to know much about it, it was just running some X-demos.
ST User, or ST World did a 4 or 5 page article on a visit to
Perihelion, the developers of the hardware. Interesting reading, but
someone borrowed my issue, and I never got it back. :-(

I played the IBM version for a couple months before I got my ST version to
work. The big differences I find are:
Fewer animated sequences - I always skipped the Bridge building anyway.
Survey takes longer on ST - of course, I was running it on a '286.
The ST can load a game while you're playing - IBM has to quit and run.
The graphics (opening sceen) looks better on the ST (IMHO) and I was using
VGA too.

I wasn't using a mouse on the IBM, but the ST version doesn't really have
'pull-down' menu's. Seems that MicroProse did a straight port and forgot
about the nifty GEM windows and schtuff like that.

Works great though. I haven't run into any bugs beyond the installation
thingy. Doesn't crash at the end or any thing.

Nearly worth the $50 bucks I paid.

:-)

Dave

Don't blame me I just inherited it. :-)

Version 3.2 is to be posted RSN, I just want to make sure it runs with
all the different UUCP implementations. Be patient...

One thing that I will suggest is go have a play with DC Format V3.2,
it has a feature to install small boot sector programs, one of these
is By_pass Hard Disk.

I use this with my ICD utils installed on a floppy, Auto booting, for
these kind of problems.

But there is another way, use Desk Manager or Super Boot, this will
allow you to get out of these situations as you can control the running
or programs in your Auto Folder..

3787. MiNT libraries: new version available

Newsgroup: comp.sys.atari.st
Date: 1991-10-24 01:25:44 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1991Oct23.212544.81@uwovax.uwo.ca>
Source record: 227818
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've sent the latest version of the MiNT library (patchlevel 14) up to atari.archive.umich.edu. There are a lot of changes from patchlevel 10, most notably support for the new features of MiNT 0.9 (which is being beta-tested now; sorry for the delay!). If you want a sneak preview of what's going to be available in MiNT, grab the libraries :-).

I hope to have the new version of MiNT itself in a shippable form in a week or two (fingers crossed).

I have two suggestions:

1. To get out of your immediate problem, turn off your Hard Drive and boot the system with a floppy. After it is at the desktop, turn on your Hard Drive and let it get up to speed. Then run AHDI and you will be able to access your Hard Drive. This also works if you put a .ACC file in your ACC path and it messes you up. I don't reccommend doing this often, or at all really, unless you absolutely must. It might damage you r Hard Disk. I'm not sure.

2. If you can program, create a program that only has one function: rename. Then have it only become active when a shift key is held during the boot. Then you could have it ask you the source and new name. This is better than installing a large booter program like Superboot, and should only take up a few K.

I hope this helps you out.

Message-ID: <49146@cup.portal.com>
Source record: 227904

It's also worth pointing out that the GEnie "flat monthly fee" ONLY applies to things like the Scuba Diving Roundtable, the Basket Weaving Roundtable, and things like that.

If you want to access the Atari Roundtables, the IBM roundtables, indeed, any of the machine-specific computer Roundtables, the billing clock kicks in at $6.00 per hour, nonprime time.

Also, the "Basic" flat rate ONLY applies to reading messages in the "Basic" Roundtables. If you want to download a GIF picture of blow fish on the Great Barrier Reef from the Scuba Roundtable, it's $6.00 per hour again. Realtime online Conferences (multi-user chat) are also $6.00 per hour.

GEnie Mail is included in the basic flat rate, but XMODEM file mail is not. Sending or receiving files by mail is $6.00 per hour.

In other words, there are a LOT of "gotcha's" involved. You need to be very aware of what is included, and what is "extra cost".

Back to the original subject... no, there is no InterNet mail connection to GEnie.

There IS, however a two-way InterNet connection to CompuServe.

Source record: 227905

Questions about joysticks for the ST...

Any "switch type" or "digital" joystick labelled "for use with Atari 800
Commodore-64 or Atari 2600" will work with the Atari ST.

Any IBM style joystick will NOT.

Any joystick labelled "for Nintendo" will NOT.

Actual choice of which Atari style joystick is a purely personal thing.
I prefer the original Atari joystick... yes, they break, and yes, you
have to replace them fairly often, but in my experience, they're FAR
more controllable and responsive than other, more durable units.

Your mileage may vary...

In a previous article, strachan6183@mtroyal.uucp () says:

>In article <Dy1101w164w@shark.cse.fau.edu>, mikal.bbs@shark.cse.fau.edu writes:
>> Someone mentioned two machines Atari is/was (rumored?) to be
>> working on called Panther and Jaguar. Does anyone know what
>> they are or where rumored to be?
> The Panther is supposed to be the next St and the Jaguar is just an atari
>console similar to the megadrive or the super famicom
>

Your the first person that I've heard say this...

What I hear is that the Panther was to be Atari's 32-bit video game system.

They were planning to release it in January of 1992.

They were also working on a 64-bit video game system called the Jaguar.

The Jaguar was to be released sometime in 1994.

However, the Jaguar was way ahead of schedule so Atari scrapped the Panther
and decided to go 64-bit all together.

The Panther would have kicked butt if released the same time as the Super
Nintendo but I guess Atari figured that would not be possible.

Can you imagine what the Jaguar will do?

The Panther would have cost $200.

I bet you that the jaguar will have a price around $300.

I have also heard that Atari may try to use some of the graphics and sound
of the Jaguar into a new ST that they are building and plan to release in 1992.

Now, if Atari can get both the Jaguar and the new ST compatible with each
other, I'll buy all the $2 stock that I can get my hands on.

3793. Atari Computer for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-10-24 05:30:49 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Oct24.053049.13223@umbc3.umbc.edu>
Source record: 227748
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

FOR SALE:

Atari 1040 ST $275
1 meg main system memory
Internal 720K 3.5" disk drive
TOS 1.4 Operating System ROMs
Atari standard mouse (Japan)
Has solder holes for Blitter on MB

Atari SC 1224 Color monitor $200
Original super-sharp JVC model

Surreal Systems Internal Clock (w/software) B/O

Abacus Chartpak B/O

If you buy the ST and monitor for $475, I'll throw in the clock,
the Chartpak software, a printer cable, and a modem cable!

If you have a trade in mind, then go ahead and ask. For now,
I am looking for mostly IBM and generic stuff: SCSI Hard drives,
laser printers, Roland MT-32 or LAPC-1, etc...

Anyway, if you have an offer, then make it! The worst thing
that can happen is that I'll say "No way!"

I prefer email, but if you would rather call, you can reach
me at (301) 521-0015.

Thanks!

520STe is the STe with 0.5MB RAM in it, yes, they are real. In fact some 520STe
came with some games boundled with it. (look in RUN PC's AD in Current Note for
titles, I don't remember them).
For upgrading to 4MB machine this is better buy, because they are cheaper than
1040 and only waste 2 256KB SIMMs in steaded of 4 256KB SIMMs in 1040.

In answer to the actual question, just about any joystick with a "standard" D-Socket, will work with the ST.
I personally have a Konix Navigator and have found it the best I've ever used, especially if you want to use it for any length of time. It is one with a pistol-grip/trigger, with the stick on top, and beats the pants off any of those square based ("Ergo what?) things.
The only game I ever used a different one for is Prince of Persia (excellent game if anyone is interested), as it is sometimes hard to hit diagonals with 100% accuracy.

Thanks for reminding us of all this Bob. I dropped my
subscription to these pay-services when they imposed the
flat-rate system. I thought it was, and still think it is, a
rip-off. I do sort of miss access to the Gadgets forum on
Genie, but it is not worth paying for other people to read the
other non-computer forums. Anyway, I was just wondering if
anyone knew how these services were doing financially, as a
result of their change in philosophy about charging
subscribers? It might serve as a lesson in the future.

From my own observations, the services are doing quite nicely, thank you very much.

What one has to realize, of course, is that EVERYONE isn't interested only in the computer-related areas. Also, although you have access to a wide variety of newsgroups at relatively little cost (hint: it's called USENET NEWS...), the majority of computer owners don't have such access. For them, $4.95 per month is quite cheap to access Roundtables such as the Science Fiction Roundtable, or the Religion Roundtable, or the Small Business Roundtable.

Someone could log on every single evening, from 6 pm to 6 am, and =still= not capture every new message from all of the Roundtables available at that $4.95 flat fee.

As for access to software libraries, et al. ... well, I was paying $6.00 an hour before the fee was instituted, and I'm still paying $6.00 an hour after the fee was instituted. So?

The point is that I'm NOT paying $6.00 an hour to read the non-computer-related Roundtables ... and that is, I believe, the primary 'good' which comes from that small monthly charge.

Sure, you get to read the rec, soc and talk groups via USENET NEWS. But you're being subsidized by at LEAST $4.95 a month in order to do so. For those who don't have that option, the GEnie flat rate is a bargain.

The server rusinfo.rus.uni-stuttgart.de (or rusmv1....) has a
mail-server. Write email to
mail-server@rusinfo.rus.uni-stuttgart.de
with empty subject and `help' in the mail body to get the newest help
page.

I've had problems when using a mouse accelerator (SpeedMouse) and the mouse/keyboard option, but switching the accelerator off seems to fix it.

Does anyone fancy trying to explain the Station Report boxes? I've read the docs but don't quite follow just what the various lines/half-lines/box-chars are trying to tell me.

Email's fine, if you think it's not worth net-bandwidth.

>
> I have 1Meg & 2 floppies, of that makes a difference.

It makes a big difference. GNU C really needs a 2MB machine to compile
anything non-trivial, and if you look at the binary archives at a.a
you'll quickly see that GCC loves hard disk space.

Sozobon C runs well on a 520ST with two floppies. A good disk cache
will make it much more pleasant.

The big difference between the compilers is that GCC supports the ANSI
C standard, and Sozobon is a tradional (K&R C, Classic C) compiler. It
has some ANSI features and a fairly complete library, but it does not
support function prototypes.

I have enough RAM and disk space for GCC, and I own a commercial compiler
(Mark Williams), but the one I use is Sozobon.

> --Gerry

In GEnie's case, the result was rapid growth. I don't know about CompuServe. I quit CompuServe when they slapped on a monthly charge, for reasons similar to yours: I was interested only in the services with hourly surcharges, and I didn't want to pay a monthly minimum plus an hourly rate. On GEnie, I spend most of my time in the free forums (mostly Writers RT, Automotive, Aladdin) and my (automated) excursions into the ST RT rarely cost more than 25 cents a visit, so I come out ahead.

In the long run, I think you're going to see more services moving toward flat fees for messages and surcharges for file transfers. Competition from Prodigy exerts a lot of pressure, and the expenses for hardware and communications are going down.

GEnie has expanded its ``Basic Services'' and recently added an interactive chess game to the free list. Air Warrior remains $6 an hour, though. :-(

I thought I read that Paramont uses them, also did you see the Great
video tape that was done on a ATW, posibly by Inmos but was only 5 mins
long and had stereo sound, also had some great TV commercials,
Mobil and Commercial Union was some that I can remember, we used the
tape at a computer show here in Wellington, did create a bit of a croud
when we put it on..

>read it can make use of it, and the rest of us can easily ignore it.
>
>Be that as it may, this group does have a lot more readers of English than of
>other languages.

There are many languages in europe besides english
hardly anyone outside the home country speaks:
norwegian,
finish,
swedish,
dutch,
spanish, (perhaps a bit more than the others)
italian,
hungarian,
polish,
russian,
french (perhaps a bit more)
germain (perhaps a bit more)
greek,
turkish,
bulgarian
.... and a couple more (20 - 100)

And than we have the Asian languages (chinese, japanese etc) and
the African languages
not to forget the hundreds of dialects that are different enough to become
distinguishable from the orignal language.

English seems to be a practical world standard to me.

I read a rumor in the Atari Journal (germain magazine) that Atari is
know shipping TT's with HD-drive.

Another rumor from that magazine: Atari has a TOS 2.06 update ready for
all ST (that is ST and STE), which together with some card could
be installed in all ST models.
Atari Benelux could not confirm this.

Use uucp to copy files from one site to another, altough it might not work
I recall to have read somewhere that uucp always causes troubles.
A problem might be write permission in one of the directorys, or your host
does not support the use of uux/uucp/uuto. Ask your host administrator to
send the file to you that is most likely the quikest way

3813. Can a TTP Program Pexec a GEM Program?

Newsgroup: comp.sys.atari.st
Date: 1991-10-24 20:03:32 UTC
From: wabe@ukc.ac.uk
Message-ID: <478@hobby.ukc.ac.uk>
Source record: 227932

I have recently been developing a tiny "mini-shell" program that searches a "built-in" PATH environment variable for a named program - which it then executes using the standard Gemdos Pexec(...) command. Of course, in order to input the name of the desired program from the Desktop the "mini-shell" has to be a .TTP (TOS-TAKES-PARAMETERS) application. This already works fine with all programs that DO NOT use the GEM environment (i.e. mouse active etc. etc.) - but I CANNOT get it to properly execute any program that uses GEM. I should explain I have done all the "obvious" things i.e. used VDI to open a Virtual Workstation, left cursor mode & entered graphics mode (v_exit_cur) and "activated" the mouse with graf_mouse(257,&dummy) BEFORE attempting the Pexec(...) command but NOTHING seems to work. The PATH is searched OK and the program found - but when it begins to execute and, say, presents a fileselector (with a visible mouse) I then find that "clicking" the mouse produces NO effect AT ALL! - the mouse, though visible, does not function. Of course, if I compiled my "mini-shell" as a .PRG program, which immediately asks for the program name (and any command line arguments there may be) then ALL WORKS WELL - but I would have to write my own code to "parse" the input command line (as I could not use argv[] and argc if I invoked the program by double-clicking from the Desktop). Though not a BIG job - this seems a nuisance & a hassle to do something which "ought" intuitively to be possible.

Am I missing out on something? - or, conceivably, I "might" be attempting something which is impossible with current TOS operating systems. I say this because I cannot remember seeing ANY .TTP program for the ST that takes command line arguments and then proceeds to do "GEM-like" things using the mouse etc. Further, as an experiment, I renamed a program that used GEM e.g. the "excellent" GULAM.PRG (as a typical example) so that it ended in .TTP i.e. GULAM.TTP in this case. Double clicking on it and, (of course) entering NO arguments into its .TTP dialogue box, gets me in to GULAM and allows me to do most things that don't require the mouse. However when I tried to execute a GEM Program from GULAM - the normal command being:

gem GEMPROG.PRG

it failed to work just like my small "mini-shell" failed (Mouse Clicking fails to Fileselect etc. etc).

I'm sure there are experts out there that can enlighten me - either by informing me where I'm missing out or confirming my suspicion that it may be impossible (in the which case I will not "waste" any more time "attempting the impossible")

Couldn't you uuencode the file on the R6000, copy the parts to floppies using mtools and then uudecode them on the ST? I believe that the umich archive has a uudecoder; that might do the trick.

I also have a QuantumLPS105. I know that it works fine with other SCSI
drives - I had to transfer all of my old data to the new drive - I had a
Quantum80S and both were being run off the same old (not Advantage) ICD host
adapter. You just have to make sure that you have removed the jumper that
enables parity (EP) which I believe SUNs use, and you need to make sure that
the drive in the middle of the SCSI chain has it's terminating resistors
removed. It SHOULD work then.

3817. HELP with problemic keyboard

Newsgroup: comp.sys.atari.st
Date: 1991-10-25 06:04:34 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91298.020434JJL101@psuvm.psu.edu>
Source record: 227805
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Recently I have been getting more and more problems with my 1040ST keyboard!
Any help would be appreciated. Often, a number of the keys will cease to work.
In poarticular the z x n m and / keys most often. They also will often work,
but with numerous keypresses only.
If I give the machine a slight drop to the table, the keyboard usually goes
back to just fine for a while. Would cleaning the keyboard help? The keys
'feel' as the usually due. Not really sticky, but the machine is old. Any
one ever have similiar problems? If so, please let me know.
]
Thanks in advance

>Any suggestions?

Well, of course I have!

There's that wonderful program named "ViewGIF 1.2". You can find it in many
ftp sites under "VIEWGIF12". The program is shareware.

It runs in *all three* resolutions and works on big screens (like OverScan)
and the TT as well. It also transforms GIF-files into SPU, NEO, PI1 and some
more exotic formats. Other options are shrink and clip.

This program is an absolute MUST for handling GIF-pictures.

Regarding Gerry Greenberg's comments and questions about how the services which have instituted flat-rate schedules are doing...

I don't have any actual figures from GEnie any more, but I do know that the CompuServe marketing department does not consider them to be "the competition (that "honor" goes to Prodigy and America OnLine).

There are plans in the works to experiment with flat-rate schedules on CIS, but I don't know how much I'm supposed to say about that at the present time. I do know one of the possible plans will make the CIS offering a LOT more attractive than the fixed set of "basic" services GEnie offers.

As for other impacts of the flat-rate system on GEnie, people internal to GEnie have noted the change in the "class" of customers they now get at essentially $5 a month. The average user is a lot more juvenile and much less technically oriented than when the rate was $5 per hour.

Also, the immense increase in the sheer numbers of users at $5 per month has virtually crippled the response time of the system. I recently tried to upload the current PC Report online magazine and read and reply to one E-Mail message on GEnie... I was in E-Mail for over 30 minutes..!
While sending the reply to my E-Mail, it was taking 18-24 seconds for the prompt for the next line to come back after hitting Return. Moving from one area to another was excruciatingly slow. Granted, I wasn't "paying" for the time spent waiting endlessly, but I figure MY time is worth more than that. I suppose if I'd waited until 4AM, it might have been faster.

HI Jan,

could you please send this new UUCICO version to comp.binaries.atari.st ?

And: Will this version be able to use TT Fast RAM ?

Thanks

Bernhard

3821. Interrupt handling mouse & midi.

Newsgroup: comp.sys.atari.st
Date: 1991-10-25 09:09:11 UTC
From: geert@ccsds.ahold.nl
Message-ID: <2921@ahds.ahold.nl>
Source record: 227938
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am (still) writing a midi program for a synthesizer. Because the
synthesizer I have, can sent lots of data in one time I must
have an midi interrupt routine that works indepently from
the mouse interrupt routine.
I have written an assembly interrupt routine to
read the mididata from the midi port of the ST, but when I sent
lots of data to the ST and I move the mouse, even this results
in loss of data.
Unfortunately, atari has connected the midi and keyboard chip (which
handles the mouse) to the same interrupt pin on the interrupt chip.

Now my questions.

Does somebody have the same experiences?

Where can I obtain info about the mouse routine of the ST, so that
I can write a new (and faster) routine for the mouse, which does
correctly handle midi & mouse together?

Maybe there is an other solution for this problem, any help
appreciated.

Geert.

Message-ID: <kgfu70INNll6@iraul1.ira.uka.de>
Source record: 227806

Sozobon is fine for doing little programs and compiling ST-stuff, but if
you want to port UNIX-PD or want to do a bigger project you should
use GNU-C, because it's ANSI and zou have better support for bigger than
64k Programs and Data.
For bigger projects a HD is recommended anyway and the memory expansion
doesnot harm. I used to work with to floppies on a 1 Meg machine, but
things i have done then in 1 hour do are now done within 5 minutes, because you don't have
to arrange the things for compiling and you have
the crossreference handy, you have more than one version, if you do
debbuging and so on ...
The speed increase is much more than the hardware speed increase, because
the work flow is much better.

So, if you want to try a bit and compile now and then Sozobon is the
choice, if you want a programming tool, GCC is better (Turbo-C 2.0, or
Pure-C as it is now called, is easier to use, but not PD) and don't
mind the price of system expansion, it's the fun tax.

Knut

P.S. Keep in mind, that the new systems like the 1040STE are cheaper to
expand and the packet prices are even cheaper. I bought a MEGA STE
for 400 DM (300 $??) more than the price of a 4 Meg Expansion and
a 48 Meg HD (>500 KB per second, not wait and see HD)

It's not bad, but it's the slowest GIF viewer I know, and it doesn't handle
STe colors. The GIF to SPECTRUM grabs always the to left 320 * 200 pixel for
conversion 8-(((.

You can either

a) get the replacement for the GULAM 'cat' (which is broken) from the
twitterpater archive (binaries/volume6/cat)

b) UUEncode into pieces on the S/6000, UUDecode the pieces together again
on the ST (you might have to edit the 'include' line if you don't use
a Dumas' compatible UUE like that available for ST's).

>
>I have Speedball and am thinking about Speedball II. How is SII?

Excellent. Bigger, better, faster, more addicting. The manual and
"program" are very, very funny... I consider this game a "must have".

>Any suggestions for a new game (preferably action/xlnt graphix)?

I've become a Bitmap Brothers convert. All their games look great,
have great music, intelligent, glitch-less interfaces, and are
fun and challenging but eventually beatable (the key word here is
"eventually). If you haven't tried GODS, you're missing something
spectacular. I'm looking forward to my copy of Magic Pockets in the
mail any day.

>applies to things like the Scuba Diving Roundtable, the Basket Weaving
>Roundtable, and things like that.

There's lots of good stuff included in the basic rate, assuming you have any interests at all outside computers. I would think that all ST MIDI users would get their money's worth from the MIDI roundtable with C-Lab and Dr.T's on-line tech support and much discussion of ST MIDI specific issues. I regularly read three of the flat rate roundtables, and often check the UPI news and sports... I've been able to cancel my newspaper delivery by using the on-line news.

>If you want to access the Atari Roundtables, the IBM roundtables,
>indeed, any of the machine-specific computer Roundtables, the billing
>clock kicks in at $6.00 per hour, nonprime time.

The hour or so it takes to learn the Aladdin navigator program makes accessing the "prime" services quite reasonable... I check the Atari boards at least twice a week and download several files every month and have never paid more than a total of $20 in a month.

It really is quite addictive. Fourtunately I've stopped playing it because
I had too...but when I get some time to spare I sure would like to give it
another go.

The most annoying thing with this game is that the computer players don't
abide by the same laws as you have to, which means that they can expand
quite a lot faster than yourself...at least I found it to be so when playing
on the European theatre.

>other than the install program having the misnamed file, which can be fixed by
>simply doing a copy of both floppies to the hard disk.

>Has anyone seen bugs during game play? Does it seem up to par versus the PC
>version?

I've played the game in all theatres and especially the European one,
from 1900 to mid '80s...sure is nice to see those French built TGVs roam
around...

I've found no bugs within the game except that it doesn't clean up properly
after a game making it hang. If it did't I usually went for a reset
anyway...to be on the safe side...

In article <5909@gmdzi.gmd.de> huber@skye.gmd.de (Hans Huber) writes:

| MTOOLS on a SPARC - Station with SUN OS 4.1.1 did not work for me, but you
| can do the following:
|
| format an MSDOS compatible floppy (DD) on the SUN:
|
| fdformat -Ld
|
| mount the floppy drive as a PC file system:
|
| fdmount

Maybe this is only locally, but in the SPARC mntdisk family there is
now `dosmount.'

dosmount -f to format low-density

dosmount -m to mount

dosmount -ue to unmount and eject.

The rest remains the same:
|
| cp *.txt /pcfs
|
| (the floppy filesystem is called /pcfs)

Just be careful to redo the serial nos. on your Atari!

~>Thanks for reminding us of all this Bob. I dropped my
~>subscription to these pay-services when they imposed the
~>flat-rate system. I thought it was, and still think it is, a
~>rip-off...

At first I was perturbed, but after much use I think my bills are lower. It's especially nice to be able to use Sabre cost free, since I don't feel under the gun to enter and exit as quickly as possible. Also, Aladdin makes a major difference in how much can be done in how little time. Truly a stellar program.

Of course, you'll pay $12.50/hour on CI$ to do virtually anything...GEnie let's you do lots of stuff for $4.95/month, everything else is only $6.00. Of course, CI$ not having prime time rates is nice if you wish to access during the day...I'd say Delphi's $20/20 hours plan is the cheapest on-line service for power users, but I don't think the breadth of information is as great.

Source record: 227811

Thanks to everyone who responded to my request for info. I got LOTS
of suggestions to use MAXIDISK because it has a built in ability to
have programs copied to it at bootup.

One thing about MAXIDISK is that it compresses files stored in it.
Thus, it is slower than other ramdrives. I need a program that copies
regardless of the ramdisk program.

I've already had two offers of programs (which I've asked for).
Please drop this thread and I'll post info about how these other
programs work, if poeple ask about them.

3837. Captive

Newsgroup: comp.sys.atari.st
Date: 1991-10-25 23:40:14 UTC
From: at731@cleveland.Freenet.Edu
Message-ID: <1991Oct25.234014.2754@usenet.ins.cwru.edu>
Source record: 227820

For anyone out there who liked Dungeon Master and Chaos Strikes Back!, I would have to recommend the game "Captive". I just got it last week and I must say that I like it tremendously. It's similar to DM in that you control four characters (droids, in this case) by a remote control.

Anyone else have this game?

The documentation is intentionally sparse, but here are a few things I've found out: When you start out in your ship, one of the planets has a blinking green dot on it. Any ideas what this signifies? I decided it was as good a place to start as any, so I landed there. You want to make sure you land at the landing spot, otherwise you land in water and can't go anywhere without damaging your droids. It was a simple matter of getting into a dungeon complex adjacent to the landing site. The only problem is getting OUT of it. (Anyone know how to do this?) Anyway, look for wall sections with rollers on the bottom. These can be pushed by clicking on the forward arrow with the right mouse button. Also, in some places there are electrical outlets close to the floor. Click on them with the hand icon, and the hand will become electrified. By clicking it in the viewscreen, you can actually shoot this electricity at monsters which is very helpful. Also, if you pick up a droid's chestplate with an electrified hand, it will recharge that droid. Be sure not to pick up anything else when you hand is electrified though- most things will explode! (I accidently fried one of my droid's CPU chips by doing that.)

Any other opinions on this game?

Could somebody (if AT ALL possible) move this stuff to North America ?
I can get there now with ftp but it feels like a satelite link or
something. It'll occassionally timeout. Also this is a HUGE chunk to
be ftp'ing across the Atlantic. (I have the readme (it's in English,
there's another file [info] in German) & am willing to post it here if
enough people are curious (& it's not TOO much of a netiquette faux-pas.

I do know that I WANT THIS !!!!! I just would like a closer site to
get it from.

In this vien, cs-tex claims to NEED a minimum of 1 meg of free RAM. On
a good day I can only cough up 900K (with NOTHING except a harddisk
driver going.). Does ANYONE know of a RAM upgrade for a stock 1040STf
(TOS 1.2) that (preferably) uses SIMM's. I don't feel like taking on
the do-it-yourself route. I have the ability, just don't have access
to the tools....
So... something commecial THAT WORKS !!!!!!

Thanx for any help....

-Andy-

Well Volker, I took your advice. I downloaded the 8 disks from a German ftp site. The TeX you describe is faster, more reliable, and easier to understand.

I think that my document will have to include a cs-TeX section. In fact I think I will recommend it over what is currently in the atari archive.

NOW MY BIG QUESTION IS: Why haven't American users puts CS-TEX on the terminator archive in Michigan. It is faster to download from and has better over USA access. I am going to attempt to send the 5Mbytes of data to terminator (asking for permission first).

CS-TeX is tremendously better than the stuff we currently have.

Mark Lehmann
tamuts.tamu.edu!n160ao

PS. I'm compiling the USA TeX document tonight (10/25/91).

3840. GENIE (Was Re: GENIE email)

The flat rate for GENIE is not a bad deal from my personal view point except that they charge $2/hr connecting fee from here (Fort Collins, CO) which Prodigy don't have that surcharge here. Serval local computer user has called GENIE many times ask them about change it, the answer is GENIE don't feel it's necessary to change this area into normal connecting area, even though near by citys has been combined into here as one local phone call by US west.

3841. Jpeg v1.0 source released; can someone compile on ST?

Newsgroup: comp.sys.atari.st
Date: 1991-10-26 06:59:11 UTC
From: bryanw@netcom.COM
Message-ID: <1991Oct26.065911.6910bryanw@netcom.COM>
Source record: 227824

Hi there. The JPEG compression/decompression programmes, version 1.o, have been released as SOURCE CODE. It is in C (I believe.. got me). I have successfully compiled it on my Unix box. However, I would like to use it on my ST as well..

For you see, I call into my Unix box from home, using my Atari ST. I am interested in posting GIFs to the Usenet (a.s.p, a.b.p, etc). In order to do so, I need to upload files from home to my Usenet account.

It would be sufficiently more efficient to be able to use JPEG on my ST, to compress the GIFs, upload them to my Unix site (in less time), post them on the Usenet, and then let others download it to their machines (in less time) and decompress it.

JPEG can reduce the size of a gif by 4 times, though that is in ideal conditions. Most of the time a compression of 2x is desirable, with a minimum loss in quality.

I would compile the stuff on the ST myself, save the glaring fact that I do not know how. Also, I suspect I do not have enough resources.. Only a 1040Stf with its internal floppy drive.

Therefore, I am asking for help: Could someone compile the JPEG source code into programs that can be used on the Atari ST? So far they have been compiled to work on the Macintosh, Amiga, and Unix systems.. Why not the Atari as well? The JPEG documentation says that the source should be portable to "most decent compilers.." isn't the ST a decent computer with a capable compiler?

Whomever wishes to help (there are more than myself who would benefit from this, I might add), send me a brief note and I will provide ye with the source code via email.

Thank you,

> evnt_* routines do not work when mouse in the TOP row
>
>Is there a way to use the AES and event_multi to get a click event WHILE the
>mouse is in that TOP line?
>
Your problem is that AES is initialized and expects a menu bar in the TOP
row. This means that when the mouse is in the TOP row AES gives mouse control
to the MENU manager.
One solution is not use AES at all not even for event polling. Use AES only
if you want to use menu's and dialogs.
There are VDI functions that can perform this task for you. Describing them
here would be to much so I suggest that you get your hands on a good book
about VDI (Profibuch) and try to figure out how to use VDI for this.
If you run into a specific problem that VDI cannot solve according to your
knowlegde ask again.
Some function names you should look at are:

vex_motv install mouse movement interrupt vector
vex_butv button
vrq_valuator several input routines
vrq_string
vrq_locator
vrq_choice

Hope this will help you one step futher!

Source record: 227847

In <1041@carl.pppl.gov>, Bruce Scott writes:
>Hello all,
> I use the Absoft FORTRAN quite heavily from time to time.
>I would like to be able to find the 32kbytes (right?) which contain the
>data for the monochrome screen in memory, and copy them elsewhere from
>a FORTRAN program. Is this possible at all? I've never seen info like
>this anywhere, but I'm sure this is a FAQ to someone in the know.

Use the VDI function vro_cpyfm or vrt_cpyfm
You will need to create two Memory Form Definition Block's which will look
like this

```
typedef struct
{
void *fd_addr; form adress 0L means screen adress
int fd_w; form width
int fd_h; form heigth
int fd_wdwidth; form width in bytes
int fd_stand; coordinate type
int fd_nplanes; # planes
int fd_r1; resereved
int fd_r2;
int fd_r3;
} MFDB;
```

set fd_w and fd_h to maximum screen values and use the pxarray to cut a
piece out of the screen. The needed information about screen width/height
etc can be found in de 'workout' array of v_opvwk or vq_extnd.

I assumed that you can open a VDI workstation from Fortran, if not
use form_dial. But the last one is limited to a quarter screen size and
does not allow futher manipulation of your buffer.

Try uuencoding it, splitting the encoded parts and recat them at your ST and
decode it again.
Splitting the binary and recatting it on your ST has the problem of
different line ending rules. The Gulam cat probably assumes ascii files and
adds \n\r characters. Using uuencode to force getting ascii solves this
problem. Any uud should be able to handle '\n' and '\r\n' endings

The one thing I really like about GEnie (which makes it well worth the $4.95 flat fee) is the fact that it is the only information service that my stepfather in North Carolina subscribes to, and the GEmail is included in the flat fee. I get more than my money's worth out of that part of the service: I am now in relatively constant communication with home while I am in exile in Florida for a whole hell of a lot less than what AT&T would charge for the comparable phone calls.

A couple of things that I would like to see them do (and yes, I have sent feedback to them...many times!)...

1. Make all of the BBs into the flat rate....charge the surcharge on files and stuff like OAG, etc.

2. Put HSTs or Dual Standards on the high speed dialups...their V.32 modems lock out the vast majority of high speed users.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have used the microprose Flight Simulator II for years, and was sad to find that it (apparently) fails the copy protection when run on my 1040STe. It runs, but it goes to "demo mode". A call to microprose requesting an update was not fruitful.

Does any-one have a version that does run on the 1040 STe with color monitor? If they do would they be willing to supply a copy?

I do not believe in piracy, and will be willing to risk sending my original disk as proof of ownership.

An alternative might be a patch for the original program that turns off the protection check.

Any Ideas, any-one?

TOS 2.06 is ready, this is no rumour. Atari released TOS 3.06 and 2.06
on the SYSTEMS fair in Munich this week.
In Germany TOS 2.06 for _all_ STs is distributed by Artifex. The package
includes an adaptor kit so that the new TOS can be used in the old ST
models.

>All of this could be yours for $700 or best offer!

Great sales pitch, maybe he could sell my 1040STf for me, he is so good ad ad writing!!

>Reply to net or phone me at 816-756-5189. (Ask for Bobby)

Geez, you can buy a brand new 1040STe for $399, and a new color monitor for $300 so $700 for his system just gets you an extra floppy drive.

Used 1040STfs are (or aren't (-( ) selling for about $200 to $250, with used color monitors going for about $150 and used floppy drives for about $50. so a realistic price is about $400 to $450, not the $700 Bobby is asking.

If you wanna pay $700 I have a 1040STf with TOS 1.4 and 2.5 megs RAM and a SM124 monochrome I would like to sell for $700. Ask me about it!!

Bob...

I have not seen what you have seen guy..
I have logged into GEnie time and time again and NEVER have had to wait extended periods of time to do anything...
And I don't know where you got the idea that GEnie is only $5 a month..
You still pay the $6 an hour.. The $4.50 is a base fee no matter if you use the system or not. However you get a few services for free.
The ONLY place I have seen that this could bring the "kids" to is the single player online games..
Most of the other "free" things are usable only by students or bussiness people.
(Other then the games)
Of course anyone who has been around the networks for ANY length of time know you cry about things just to cry...
If YOU don't like it then don't use it.
GEnie works just fine...
I still pay about $30 a month using it...

Atari 1040ST computer and Panasonic KX-P1080 printer.

Like New !!!!

Software:
ST Writer (word processor)
VIP Professional (100% compatible Lotus 1-2-3 clone)
Basic, C, Logo, Lisp, and other languages.
Several games
Lots of Public Domain software

Hardware:
68000 processor
1meg memory
Atari SM124 Monochrome monitor (640x400 resolution)
2 720K floppy drives

Printer:
Panasonic dot matrix printer
fast
draft and Near letter quality modes
words fine with Atari computer. Also would work with IBM computers.

Price: Make an offer for one or both

Chris Stluka

3857. Tempus II / Rapid fire

Newsgroup: comp.sys.atari.st
Date: 1991-10-27 05:38:52 UTC
From: ekrimen@wet.UUCP
Message-ID: <3038@wet.UUCP>
Source record: 227841

(I sure hope this works.)

I'm having trouble getting Tempus II to load. I get an "Unusable system" error before the file selector comes up. I'm told that Tempus II may be taking up a VBI slot without expanding the tables. Does anyone know of small AUTO program that will expand the VBI table?

I am also looking for the author of the Rapid fire documentation at atari.archive. The documentation describes how to make a joystick rapid fire connector. If you know the author's name, please send me e-mail.

3858. FALL COMDEX brings packages

Newsgroup: comp.sys.atari.st
Date: 1991-10-27 06:05:17 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1991Oct27.060517.12539@usenet.ins.cwru.edu>
Source record: 227837

Well, looks like Atari's about to start mass marketing its lower-end computers that will eventually mean- more and more software and products for the ST and STe.

Atari released the Discovery XTRA package in the United States.

This package consists what many people in Europe have already seen.

A 520 STe, SC1224 color monitor, and lots of games.

The Family Curriculum package which will consist of the 1040 STe, SC1224 color monitor, and games and applications.

The prices of these packages were not mentioned but I'm guessing that the Discover package will be less than $699 and the Family package will be less than $799.00.

The amazing part of this news is that Atari claims it will be made available in two weeks.

What does this all mean?

This means that all those people who are selling their STs may end up with one again in a few months.

The main problem was the lack of new software- the IBM, Mac, and Amiga would get software approximately 6 months earlier than the ST or the ST wouldn't get it at all. The mass marketing of these computers will give the ST the software it needs.

I was considering selling my ST, not anymore folks... the package was called VERY impressive by many- including the box that it will be sold in.

Atari also stressed DTP and MUSIC as the markets that they will be concentrating on.

What does this mean?

Atari computers may become very serious contenders in the DTP and music market and all the other software that you love may "trickle" down from there.

The mass marketing of the STes will most likely create a great amount of game availability.

Atari also released 4 IBM compatibles ath the show. One was a slick looking notebook. The 3 desktop computers were called ugly to most but interesting in a way.

And lastly, the ST Notebook was released at the Fall Comdex.

Looks like, Atari is making a big effort to get into the "professional" world, even though it may be through niche markets.

I can live with it.

I guess the MAIN thing that will determine the success of the computers is,

WILL ATARI ADVERTISE?

and

WILL ATARI GET ENOUGH DEALERS TO ACTUALLY SELL THESE COMPUTERS?

We'll find out.

> Who it is? For me to know for you to guess.

Yes I have heard about a TOS 2.07 Upgrade but at a very high cost..
Quoted to be some $100 us.

Here in New Zealand you can get a Amiga A500 version 1.3 kick start rom,
(256k rom, same size as the STE rom), fitted for $80 nz.

But the cost of the Atari TOS 1.4 here fitted is $200 nz, I for one do
not think that Atari is playing the Game, if they wan't more users
to go for a better bug free TOS it should be for just over cost, and
not the rip of price that it now is..

Note: Two 1 meg E-Proms cost here $35 nz, this is the size of the STE Roms,
so why should I have to Pay $200nz, when Commodore here, only charge $80nz for
the same thing..

So Atari lets have some better prices for the Rom Upgrade Please..

I'm having some problems with my floppy drive; the damn thing seems
to boot up only when it wants to, and only off of selected disks. The problem
seems to vanish for any particular disk once it boots correctly, though--
that is, if I get a successful boot from one disk, and _don't change it_,
most subsequent operations seem to work. Took me about two hours to make a
successful backup from an old copy of Flash.

Does this sound liek a hardware problem, just the need to clean the
thing out, or could I have _gasp_ a Virus?!?!?!? (Aw, Gosharootie, NO!)

And I'm wodnering what the price on a used 1040 St would be, with a
few neat packages of software. Any buyers?

3864. PC-Ditto I vs. Mega4 ?

Newsgroup: comp.sys.atari.st
Date: 1991-10-27 17:19:25 UTC
From: dshaw@cpva.saic.com
Message-ID: <7666.290a849d@cpva.saic.com>
Source record: 227843

I've had some strange problems with PC-Ditto I since about the time I got a Mega4. Although PC-Ditto comes up and indicates that there's about 700K available, some PC programs don't run, giving an error message about not having enough room to run the program. These same programs ran just fine when I was using a 520ST with 1MB RAM. I'm not certain that this is the precise time that the problem began occurring, but wondered if anybody else had had similar problems, or had run PC-Ditto I successfully on a Mega4. (some PC programs do run ok).

3865. Diamond Back II

Newsgroup: comp.sys.atari.st
Date: 1991-10-27 17:20:35 UTC
From: dshaw@cpva.saic.com
Message-ID: <7667.290a84e3@cpva.saic.com>
Source record: 227844

Has anyone else used Diamond Back II for HD backups ??? If so, have
you successfully restored files ???

I recently started using it for the first time and after backing up
my C: partition to a dozen double sided floppies (compressed, file
splitting allowed), I tried to restore to another partition. The
first floppy seemed to go ok, but when I got to the second, it was
skipped over in just a couple of seconds. Then when I inserted the
3rd as requested, I got an error message claiming that the next file
had been compressed with the wrong number of bits.

I tried a second time (I completely resaved the partition first) and
this time when I got to the second disk I got an error message claiming
the diskette was unlabelled.

Another problem I've had is that the automatic disk switching doesn't
seem to be working correctly. If I insert the next disk while another
is being used and press the drive letter as I understood the instructions,
I still don't get automatic switching when the first disk is completed.

Source record: 227850

In article <1991Oct27.153808.26902@lut.ac.uk> elmar@lut.ac.uk
(Mohammad A. Rahin) asked for FTP sites for Atari TeX.

The host is

rusinfo.rus.uni-stuttgart.de [129.69.1.12]

and is managed by DANTE< the association of german speaking TeX users.

Look into the directory soft/tex/machines/atari. You'll find two
directories with two up-to-date implementations of TeX for the Atari
ST:

cs-tex

and

Lindner-TeX

Both are organized as one directory per floppy disk.

Lindner-TeX.packed-disks contains one zoo archive per floppy disk, for
those who prefer that for FTP.

I'm not so biased as the original poster to strongly recommend one of
these implementations. Both have their strong points.

3867. FOR SALE: ST and Hard Drive

Newsgroup: comp.sys.atari.st
Date: 1991-10-27 20:03:25 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1991Oct27.200325.5747@usenet.ins.cwru.edu>
Source record: 227852

FOR SALE:

520 STfm (1 Meg) in excellent condition. Also includes mega-touch springs.
It is less than a year and half old. The system comes with all original
disks, manuals, cables, power supply, and box.

PRICE: $250.00.

Supra 20 Meg Hard Drive. A new host adaptor was recently replaced in it.
The mechinism does have its problems. A part of the mechinism sometimes
needs to be jiggled in order to work. My dealer claims that has no problems
with it and I shouldn't have any problem with it as long as I keep it on.
But since there does to be problems and I'm honest enough to say so,
I'm not charging for it. You may want to just replace it anyways since
it is only 20 megs.

Also comes with host adaptor, controller, manuals, cables, disks, case,
fan, power supply, original box, etc...

PRICE: BEST OFFER

Syncho Express. Copies all disks. 22 seconds for single sided, 44 for double
sided. Two drives required (external and internal or external and external).
Comes with software.

PRICE: $40.00.

The reason I'm selling is because I'm going to purchase a higher-end
Atari computer (Mega STe or TT/030).

Write back.

Source record: 227851
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

For sale: Atari ST Maple version 4.2

Maple is a symbolic algebra package, capable of doing algebra and calculus on all sorts of expressions. It can also graph functions and numerically integrate things it can't do symbolic. Much faster than looking up those nasty integrals in your nasty 1,000 page book of integrals written by some poor souls locked away in a Siberian labor camp.

This program is similar to other packages like Mathematica, Macsyma, and Derive. It sells for $400 (list price).

Includes all manuals (tutorial, reference, Atari installation), and the original distribution disks in shrink-wrap. Requires about 4 megabytes of disk space, plus at least 1 megabyte of ram, preferably more. I don't know if it will run on a TT or not.

I'm asking $200, plus shipping.

>You will then have a HD-formatter.

You must alao ensure that the format track buffer in the program is big
enough. Many variable format programs are useless in this respect unless
the source is fixed to give a larger buffer. I stopped using the format
program that was distributed way back when with STart magazine because it
will not format more than 14 sectors. Now I usually use KnifeST from HiSoft
for formatting as it gives complete flexibility over all format parameters.

3876. Re: FALL COMDEX brings packages

Newsgroup: comp.sys.atari.st
Date: 1991-10-28 11:20:46 UTC
From: Rod.Fulk@f24.n228.z1.FidoNet.Org
Message-ID: <688655056.1@therip.FidoNet.Org>
Source record: 227886

Well guy Flames here are highly unwelcome....
Oh and by the way, lets see how most companies would work while being worth $400million, buying a worthless retail market outlet, loosing atleast $100 million, and then try to operate....
Atari should have been out of bussiness. As of late atari seems to have been picking up a little bit of steam.
The professional MIDI market is tied up pretty much by atari since no other machine comes close in capability yet. (Timming is said to be at a premium with most machines. With amigas you can do a couple midi devices but when you get into LOTS of devices all other machines choke on it...)
The professional DTP arena is filled with MANY Atari products that are better then anything out there. Although if atari isn't careful they will loose even that portion that they have now. Realize that the Mac is the only other real contender in the DTP area. Those running IBM DTP systems are just die hard IBMers or havent tried one of the other systems.
The atari DTP systems are mainly used by the self employed or family owned graphics outfits. If atari computers were mainstream I dont think you would see anything but Ataris in either the midi or the DTP area...
Everyone else is playing catchup to the atari 3rd party products in these areas. Although the Mac has a head start number wise in the DTP area if atari makes a serious attempt at becomming a mainstream machine they will knock ALOT of macs out of the DTP arena.

As to the atari getting software.. Yes it will get anything it needs.
All atari has to do is sell machines. And lots of them. They need to get their computers out into the mass markets as well as the higher end machines in dealers hands. Mass marketing them will bring atari's name back to the forefront.

Dump tos? Yea right... Its the easiest to use OS and size/performance ratio is excelent. YOu wont find another OS ANYWHERE with as much power and grace and yet take up as little memory. The user interface is great and if you dont like it you can select a CLI of your choice...
(Try that with a Mac some time...)
When the new multi tasking TOS is available it may just bring the last item the ST could use. (Said to be march.. But hey this IS atari... ;-))

The amiga is a nice machine but its rapidly loosing ground to new IBM machines.
The only niche the amiga will soon control is the home computer games.
And any other work it will do will be mainly cause someone at home decided to use it. The ST has a much higher chance at becomming a computer for bussiness.
It has most if not all the software needed to run a company. Not only that but the way the computer is set up you can at the moment buy a whole workstation for less then $2000 and have a VERY workable system with networking, a hard drive, a laser printer and some decent software to get going on. (Note that

the atari monochrome monitor is the best out there for the money.. You need to spend lots a money to get an amiga to do the same resolution with out flickering. Unless of course you buy the Ami 3000... And even then for a comparable system you still pay quite a bit more for the amiga..)

Your reading old news with the lynx.. Last I heard they are now programming the lynx on the newer atari ste's...

Mass market them with advertising? Atari has been advertising for years.. Just not in the magazines YOU have been reading.. And amiga really did alot with its $16million tv advertising last year. From what I heard they lost all the benifits they might have gained by mid january.. Magazine ads is where its at. And atari DOES advertise..
Hmm, let see, I think I will go out and buy an amiga laptop....
NOT...

>Note: Two 1 meg E-Proms cost here $35 nz, this is the size of the STE Roms,
>so why should I have to Pay $200nz, when Commodore here, only charge $80nz for
>the same thing..

>So Atari lets have some better prices for the Rom Upgrade Please..

Did you ever think of DOS updates costing even more than the new TOS?
Comparing TOS with DOS you have to realize that TOS is much more complicated
than DOS. I think because of that it is worth the prize. In Germany you
pay 200 DM for the new TOS 2.06, including an adaptor kit to use it in
all ST models. Instead of some discs (this is the DOS update) Atari
supplies its system on roms. Is 200 DM too much for that?

From: jas@oasis.icl.co.uk
Message-ID: <116@oasis.icl.co.uk>
Source record: 227857

Before I say anything else, do not treat this article as FlameBait. I do NOT want to start a "My GUI is better than yours" flamewar, I just want some useful comments/opinions.

At the moment I am developing Windows 3 applications for the PC, but as I have an ST, I would like to try some simple GEM programs. Has anybody used both, who would like to give me some constructive advice as to how similar the two are? What I want to do is make the switch with as little hassle as possible - if they are hugely different I probably won't bother as this is for personal use rather than the Windows stuff which is my job.
I'd also be interested in the titles/authors of any good texts for GEM beginners (preferably something still in print!). The only book I've ever seen on a shelf here in England is The Atari ST TOS Technical Reference Guide from COMPUTE!. Anybody know if it's any good?

As I said, constructive comment by E-MAIL (let's save the bandwidth, eh?), to:
jas@uk.co.icl.oasis

Thanks for any help you can give me,
Jason.

> a good day I can only cough up 900K (with NOTHING except a harddisk
> driver going.).

To run (La)TeX, it's best to have more than 1MB of memory.
`cs-tex claims to NEED' this lot of memory, because the internal array
sizes are fixed to a specific size.

There's a TeX impl. for the ST where you can set most of the array
sizes with the help of a configuration file:
br-tex

Disadvantages:
It consists of `virtex' and `initex' only (no other utilities).
There's a poor documentation with many errors and I don't know which
TeXshell can be used to run `virtex'.
Advantages:
It's fast (perhaps the fastest TeX for the ST) and it's running
on a 1MB machine without problems. (It has some other features,
like `codepage' support, i.e., you can map the ST character set to
the font layout of the EC-/DC-Fonts (= extended ISO Latin-1))

Both CS-TeX and Lindner/Birkhahn-TeX are version 3.14. It doesn't make
much difference anyway. Only a few rather arcane problems were fixed.

3884. Re: FALL COMDEX brings packages

Newsgroup: comp.sys.atari.st
Date: 1991-10-28 14:41:21 UTC
From: cjherborth@rose.waterloo.edu
Message-ID: <1991Oct28.144121.24939@watdragon.waterloo.edu>
Source record: 227867

In article <1991Oct27.060517.12539@usenet.ins.cwru.edu> aa399@cleveland.Freenet.Edu (Len Stys) writes:
}Well, looks like Atari's about to start mass marketing its lower-end computers
}that will eventually mean- more and more software and products for the ST and
}STe.
Hahaha...

}Atari released the Discovery XTRA package in the United States.
}This package consists what many people in Europe have already seen.
}A 520 STe, SC1224 color monitor, and lots of games.
}
}The Family Curriculum package which will consist of the 1040 STe, SC1224 color
}monitor, and games and applications.
}
}The prices of these packages were not mentioned but I'm guessing that the
}Discover package will be less than $699 and the Family package will be less
}than $799.00.
}
}The amazing part of this news is that Atari claims it will be made available
}in two weeks.

Sure it will. Atari hasn't got any stock, and I doubt the contracts for the
software bundling have even been signed. There were about 50-60 messages
on GEnie this weekend talking about this. Looks like Atari'll miss the
Christmas season for the third year in a row. :-(

}What does this all mean?

That you're getting your chain pulled.

}This means that all those people who are selling their STs may end up with
}one again in a few months.
}
}The main problem was the lack of new software- the IBM, Mac, and Amiga would
}get software approximately 6 months earlier than the ST or the ST wouldn't
}get it at all. The mass marketing of these computers will give the ST the
}software it needs.
}
}I was considering selling my ST, not anymore folks... the package was
}called VERY impressive by many- including the box that it will be sold in.
}
}Atari also stressed DTP and MUSIC as the markets that they will be
}concentrating on.
}
}What does this mean?

The ST will remain strong in it's strengths (DTP and Music) despite Atari's
wacky ideas of marketing and product availability.

}Atari computers may become very serious contenders in the DTP and music
}market and all the other software that you love may "trickle" down from there.
}
}The mass marketing of the STes will most likely create a great amount of
}game availability.
}
}Atari also released 4 IBM compatibles ath the show. One was a slick looking
}notebook. The 3 desktop computers were called ugly to most but interesting
}in a way.
}
}And lastly, the ST Notebook was released at the Fall Comdex.

There are only something like FIVE of these things IN THE ENTIRE WORLD.

}Looks like, Atari is making a big effort to get into the "professional" world,
}even though it may be through niche markets.

Atari make an effort to sell their machines in North America? I'll beleive
it when I see the package deals in the stores.

}I can live with it.

I wish I had your faith.

}I guess the MAIN thing that will determine the success of the computers is,
}WILL ATARI ADVERTISE?

Not likely.

}and
}WILL ATARI GET ENOUGH DEALERS TO ACTUALLY SELL THESE COMPUTERS?

Not likely.

}We'll find out.

And, with any luck, we won't be disappointed this time.

>went's wrong.

Well, having older versions of the OS available on disk doesn't seem to have hurt Microsoft very much. I think it is a lot better to be able to boot up the older OS if you have a favorite program that barfs on the new one.

>They should place an Atari Emulator for PC's on the market, showing that
>emulating a little, outdated 68000 is a very hard job for those super,
>duper 80486's. May be the users like the ST-software and then buy a
>ST for using it ...

Why would anyone want to emulate an ST on a 486 box? I guess if you wanted to run a game that isn't available on the PC it might be worthwhile, but other than a few MIDI programs and Calamus, I can't think of any decent applications that run better on the ST than on a 486 machine. Many of the PC games that come out now can run in 1024 X 768 X 256 colors which makes them better at games too if you're into that sort of thing.

I just don't understand your line of reasoning.

Cheers,

Chris

>version?
>

It's run for over a hundred hours in the last few weeks with no serious bugs
on my 1040STfm. The only bug I've found is that if you load an old game
after playing another game, the lading and symbold are screwed up (like,
go from a European to an American continent, the European lading is used.
Kinda adds variation).

There are some frustrating aspects: the mouse pointer won't go far enough to
the right on the little map in the upper right, and turbo speed doesn't allow
you to do things like read reports without changing speed first. Any the broker
screen doesn't come up when you ask for it.

Source record: 227875

[In article <RV3V5PK@lime.in-berlin.de>,
techno@lime.in-berlin.de (Techno) writes ...]

> Pardon me, Howard, but isn't ARC now in version 6.02 ?

I was wondering about that, too. The version I use says:

|ARC-ST - Archive utility, Version 6.02ST, created in November of 1989
|Copyright 1985-89 by System Enhancement Associates, Inc.; ALL RIGHTS RESERVED
|
|Please refer all inquiries to:
|
| Darin Wayrynen
| 10851 N 43rd Ave #211
| Phoenix, AZ 85029

It compresses better and faster than ARC 5.xx and it supports subdirectories.
The only thing I don't like about it is that Darin has rigged arc p to send
data to the prn: port instead of stdout.

From: mc4c+@andrew.cmu.edu
Message-ID: <wd36Eei00WBKM3nukX@andrew.cmu.edu>
Source record: 227879

Here is a warning and a question:
I ordered and payed for a battery for my STacey from a company
called Multibyte. Several months later I had not recieved it, but
repeated calls to them by me assured me it would be ready "very soon".
Then I was told that the Persian Gulf idiocy was causing a shortage of
parts, and that it would take some time. After the foolishness was over,
I again was being told, "very soon". Now, almost a year since the
original purchase, their phone has been disconnected, with no
information available from the phone company. SO... If these people
resurface from the slime, DO NOT send them money until you have product
in hand.
Also, If anyone can give me info about the company, or who ran it, I
would be greatly appreciative, as I want my money back!

I just ran CS-TeX and it said that it was version 3.1 / cs 2.1.

By the way, after running CS-TeX for close to a week now, I have
noticed that it seems more like a combination of TeX 2.x and TeX 3.1.
I can't seem to build format files with a command like "tex &lpLain -i"
but instead I have to use a version of TeX called InitTeX, which is
what the earlier versions used. Unfortunatey, I don't know what to
issue on the command line to make InitTeX create a format file.
Fortunately the CS-TeX shell does all of that automatically for you.

Message-ID: <1991Oct28.200636.22090@reed.edu>
Source record: 227877
Cross-posted to: comp.sys.ibm.pc,comp.sys.ibm.pc.programmer,comp.sys.atari.st,comp.sys.amiga.programmer,rec.games.programmer,rec.games.misc

Just finally got a copy of the Microsoft Flight Simulator V4. I was
wondering if anyone has:

a) Figured out a way of converting FS4 position to Latitude and Longitude.
(Looks like you might have to do some kind of reverse Lambert conical
projection).
b) Figured out the format of messages out the serial port in multi-player
mode. Seems like you could do some interesting things with that.

Any info or pointers greatly appreciated!

From: mbarnes@finally.Sun.COM
Message-ID: <5458@southeast.East.Sun.COM>
Source record: 227883

I have the following extra Atari items for sale. All of these items are in working order. Please e-mail me or call (703) 569-8881 if you are interested in any of these items.

QTY Product Price

2 1040ST $150.00
2 ST Color Monitor $100.00
2 ST Monochrome Monitor $50.00
2 720 Atari 3.5" floppy $50.00
2 360 Atari 3.5" floppy $25.00
1 Computer Eyes frame grabber $50.00
1 20 MB Hard Drive for ST $175.00
1 520 ST w/1MB RAM $100.00

For a friend I post the following message, as an ealier attempt failed:

: I am looking for a simple bankmanager for my Roland D10
: synthesizer. I want to be able to load complete banks and/or
: selected voices from synth to disk and vice versa.

: I am also very much interested in sounds for my D10. Because I
: do not yet have a bankmanager, I won't be able to swap sounds.

: Also, I am interested in a simple way to link my Sony camcorder F450E
: (PAL) to my Atari ST1 so I can control my camcorder through my
: computer. Preferebly also with a (infra red) link to my editing
: VCR (Hitachi 7xxx).

Please respond by e-mail to erik@isc.nl.

Tnx,

> > Pardon me, Howard, but isn't ARC now in version 6.02 ?

True, but when I posed my question about it earlier some folks replied saying
they still use ARC 5 primarily, and would like to use this faster version.

>It compresses better and faster than ARC 5.xx and it supports subdirectories.

My tests show this version to be as fast or faster than ARC 6.02, and
better compression on graphic bitmap type image files. Also, since no one
has ported 6.02 to Unix yet, the improvement is of great enough impact to
make it worthwhile to distribute.

>The only thing I don't like about it is that Darin has rigged arc p to send
>data to the prn: port instead of stdout.

During my testing I also ran across a couple archives that 6.02 won't
touch. It apparently doesn't like filenames that use 8 bit characters
(like copyright, superscripts, a couple others that I've seen...).

Here's the long and the short of it, I am a very happy Spectre GCR (3.0) user, but I don't like trips to a local copy center to pay high per page prices for laserprinters that are dirty (It is illegal for me to use University Computer equipment for personal profit). Since I (and my wife) do a bit of DTP work on Spectre, I was pretty impressed with the Apple Stylewriter 360 DPI printer, especially with its student price. Anyhow, I've got it home, I just need to get it to work. I have used a standard MAC DIN-8 to DB25 serial converter, direct into my ST serial port to no avail. If anyone has had experience using the Stylewriter with Spectre (or anything else, for that matter) please drop me some e-mail, especially if you have a cable diagram for the cable you have used.

Thank you...
-Bill Mills

NOTE: Since posting access at my site is temporarily down, I am having a friend post this. PLEASE respond directly to me by e-mail, not through rn (or whichever news program you are using).

3906. Why flame?

Newsgroup: comp.sys.atari.st
Date: 1991-10-29 02:15:33 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <5354@tamsun.TAMU.EDU>
Source record: 227897

I bought my Atari 1040ST because I could afford it and because I liked the way it ran. At the time I bought it, I though Atari was going to stop selling them (1987). I have been very happy ever since.

What I am intrigued about is why every-one is so worried about the financial weight of Atari.

If I hear that Atari is going out of business, I am not going to run over to my 1040St and throw it in the trash. Why go so upset about it? Just use the tool you have.

Flaming Atari or IBM or whoever has also baffled me. I didn't see Atari personally attack anyone. Do flamers have a personal vengence with Atari? I realize that Atari doesn't make products quickly, but the Atari ST, which is discussed on this group is a great product. So why flame it as if this good computer personally makes your life miserable?

Unless you can justify your comment, don't broadcast it thoughout the world.

The Mac is becoming the MIDI machine. All I see in the US at university
music classes are Macs. Macs and NeXTs.

>The professional DTP arena is filled with MANY Atari products that are better
>then anything out there. Although if atari isn't careful they will loose even
>that portion that they have now. Realize that the Mac is the only other real

The Mac and NeXT are the king of DTP, you will find nothing on the
Atari that can handle the quality and amount (not to mention the
output quality) of these.

>contender in the DTP area. Those running IBM DTP systems are just die hard
>IBMers or havent tried one of the other systems.
>The atari DTP systems are mainly used by the self employed or family owned
>graphics outfits. If atari computers were mainstream I dont think you would
>see anything but Ataris in either the midi or the DTP area...

Take a look at Apple printer technology. Apple is announcing enhancements
on almost a weekly basis. Improved printer drivers, new font technology,
new fonts, faster and cleaner output, agreements with Adobe, etc.

>Everyone else is playing catchup to the atari 3rd party products in these
>areas. Although the Mac has a head start number wise in the DTP area if atari
>makes a serious attempt at becomming a mainstream machine they will knock ALOT
>of macs out of the DTP arena.

This has yet to be seen. Does TOS have scalable outline fonts yet? What
about display postscript?

>As to the atari getting software.. Yes it will get anything it needs.

And here's the catch:

>All atari has to do is sell machines. And lots of them. They need to get their
>computers out into the mass markets as well as the higher end machines in
>dealers hands. Mass marketing them will bring atari's name back to the
>forefront.

If this doesn't happen, developers are going to stick where the cash is,
and that is IBM and MAC.

>Dump tos? Yea right... Its the easiest to use OS and size/performance ratio is
>excelent. YOu wont find another OS ANYWHERE with as much power and grace and
>yet take up as little memory. The user interface is great and if you dont like
>it you can select a CLI of your choice...
>(Try that with a Mac some time...)

I think TOS is one of the worst operating systems availible today besides
MS-DOS or CP/M which it still resembles. TOS is no comparison to
NeXTStep, System 7.0, OS/2 or AmigaDOS. Speaking of small and efficient?
AmigaDOS offers more functionality than TOS, and uses only 192k of ram
(not it uses 512k of ROM, the 2.0 ROMs are shipping)

>When the new multi tasking TOS is available it may just bring the last item
>the ST could use. (Said to be march.. But hey this IS atari... ;-))

A multitasking TOS will be as much of a kludge as Windows or Multifinder.

>The amiga is a nice machine but its rapidly loosing ground to new IBM machines.
Amiga sales have been steadily rising. The A3000 is now outselling
the A2000. (A2000= $999 list, A3000 = $1850) The 4 millionth Amiga will
be shipped soon, not to mention the thousands of Amiga's that will be sold
inside the PC/Mac-Toaster.

>The only niche the amiga will soon control is the home computer games.
>And any other work it will do will be mainly cause someone at home decided to
>use it. The ST has a much higher chance at becomming a computer for bussiness.
>It has most if not all the software needed to run a company. Not only that but
>the way the computer is set up you can at the moment buy a whole workstation
>for less then $2000 and have a VERY workable system with networking, a hard
>drive, a laser printer and some decent software to get going on. (Note that
>the atari monochrome monitor is the best out there for the money.. You need to
>spend lots a money to get an amiga to do the same resolution with out
>flickering. Unless of course you buy the Ami 3000... And even then for a
>comparable system you still pay quite a bit more for the amiga..)

No, you spend $30 for the ECS Denise chip, and $80-140 on a composite
monochrome monitor (16 gray levels, so your "3d look" is still intact)
The A500plus, and all new Amiga's ship with this chip built in, and 2.0
ROMS. Anyone who bought an Amiga since March gets a free upgrade.
(Commodore Gold Service. If you computer breaks, or needs an upgrade,
Federal Express comes to your house, takes your computer, upgrades it and
returns it. For A2000s and A3000, you get onsite repair)

You can buy an A2000 for $999 (that's List price), purchase a Impact
22mhz 68030/68882 card with SCSI controller and room for 32megs of ram for
$900 (comes with 1mb installed) Add $500 for 16mb of ram (4mb simms),

and a $80 mono monitor. Total $2400 (if you want, spend the $500 on
Deskjet or Bubblejet printer)

>Your reading old news with the lynx.. Last I heard they are now programming
>the lynx on the newer atari ste's...
>
>Mass market them with advertising? Atari has been advertising for years.. Just
>not in the magazines YOU have been reading.. And amiga really did alot with
>its $16million tv advertising last year. From what I heard they lost all the
>benifits they might have gained by mid january.. Magazine ads is where its at.
>And atari DOES advertise..

What magazines? As I have said, Amiga sales have been steadily
increasing. It's esimated that they will ship almost 1million machines a
year now,and the Amiga hit it's 3million mark faster than the Mac did.
If you want to talk REAL advertising, look at Apple. I've seen Apple
ads in my school newspaper that are bigger, more numerous, and better
than any Commodore or Atari ad in years.

>Hmm, let see, I think I will go out and buy an amiga laptop....
>NOT...

Why do you keep bashing on Amiga? You should focus your efforts on
the real market giants, IBM and Apple. IBM has what? 4 new operating
systems coming out? (Pink/Blue, OS/2, Aix, Windows NT(microsoft)
Apple is steadily saturating the Airwaves with advertisements.
Average consumers are not going to buy an Amiga or Atari when they are
constantly bombardd about how great the Mac is, or about those
fabulous $1500 486/SVGA systems.

Is everyone? I could care less what happens to Atari. However, for the
new computer buyer who is a neophyte at this sort of thing, its sort of
a rip off to buy a machine from a company that goes under the next day.
(some people call it buy beware I call it unethical).

OR

The experienced user is going to avoid Atari like the plague for the same
reason as above, because of lack of support, little software and no upgrade
paths.

>
>If I hear that Atari is going out of business, I am not going to run over
>to my 1040St and throw it in the trash. Why go so upset about it? Just
>use the tool you have.

Well, yeah, I see your point here. But computer technology is suppose to
make our lives easier, not put them at a stand still. If Atari goes under
that means your stuck in the stone age three years from now.

CARTERS RULE #1: A computer ceases to be useful once its technology presents
zero options to the user.
(I have a small book to live by I could send you)

Although your right, you could run a BBS, still run Mac Software, and
Mr. Small...as always comes to the rescue. That would keep us cruising for
a couple of years more.., but eventually, the inevitable has to happen.
Even large fairly well off companys phase out old models eventually.
Faster, smaller, more reliable, cheaper..thats the game here.

If you think your problems end when a company goes out of business, your
sadly mistaken, case and point...JASMINE...oooo, what a mess.

>
>Flaming Atari or IBM or whoever has also baffled me. I didn't see Atari

>good computer personally makes your life miserable?

The Atari ST is a great product, as long as its used for its intended
audience it works great.

In my opinion thats:

1) Mac emulation
2) Games
3) Music applications

Anything else I just can't see. When people try and suggest spending
thousands of dollars on DTP stuff, its ludicrous! Thats when I get
cynical...and people get mad at me! Especially JUST because its an ATARI.

People flame Atari because they buy the machine and wish it culd do more.
Like me! I wish I had 7 slots tons of cpu add ons, graphics coprocessors,
and easy way to upgrade..instead of soldering anything and everything I want
to add on thats worth while..

So when Atari OBVIOUSLY KNOWS what people want and they don't give it too them
or display machines that are quite good architecturally, and then scraps them
and shoves something else in our face WE GET MAD.

Isn't that bait and switch???

[Stuff deleted]
>Yes I have heard about a TOS 2.07 Upgrade but at a very high cost..
>Quoted to be some $100 us.
I realize that $100us is probably quite a bit there (sorry, I don't know the exchange rates) but the old ROM upgrade to TOS1.4 was $100 - And That was just for the 2 or 6 chips and some documentation on how to put them in your machine. The new upgrade will have a new board (an adapter to change the starting address I would imagine, and possibly fixing the problem of "how to put 2chip sets in machines with 6 ROMs" that used to be fixed by cutting traces and other "nasty hardware" hacking - anyone know about that?) to go with the new ROMs. At least now you are getting more for your $100.
>
>Here in New Zealand you can get a Amiga A500 version 1.3 kick start rom,
>(256k rom, same size as the STE rom), fitted for $80 nz.
>
I think this was kind of a desperation move - if they didn't start putting the kickstart on ROMs, it might have seriously affected sales - after all, who wants to put in the disk to boot the system when you can have it quicker on ROMS ? :)!!! But then, thats one of the perks/problems with having an ST/TT (please, lets not start that thread again!!! :). Ah, who cares - I'm not part of the Amiga distributing heads, so this is pure speculation.

>But the cost of the Atari TOS 1.4 here fitted is $200 nz, I for one do
>not think that Atari is playing the Game, if they wan't more users
>to go for a better bug free TOS it should be for just over cost, and
>not the rip of price that it now is..
As I think many people have mentioned, Atari is a corporate beast: it does what it does because doing so makes money (regardless of how short-sighted the action). So, as long as people will fork out money for it, they will sell it as they have decided to...
>
>Note: Two 1 meg E-Proms cost here $35 nz, this is the size of the STE Roms,
>so why should I have to Pay $200nz, when Commodore here, only charge $80nz for
>the same thing..
>
Who says that they pay $35/Eprom ? They probably don't as they get them with mass-discount. Besides, you aren't really paying for the eproms, you are paying for the wonderful bug-free totally Atari compatible code that was so thoughtfully burned into it (excuse me, but I think you should get that bit o'sarcasm before drips off the monitor and ruins the keyboard...:).

>So Atari lets have some better prices for the Rom Upgrade Please..

3912. Unix utilities with '/' sought

Newsgroup: comp.sys.atari.st
Date: 1991-10-29 10:27:18 UTC
From: marc@uni-paderborn.de
Message-ID: <1991Oct29.102718.22947@uni-paderborn.de>
Source record: 227895

Does anyone know of unix utilities (ls, cp & friends) for the
ST with unix style path separators ('/' instead of '\')?

When using BASH with MiNT it's rather annoying typing always
things like c:\\usr\\spool\\mail :(

Or, is there any other decent shell out that is aware of MiNT and
has tools like those above built in (like gulam)? I assume that
an updated version of gulam that will support MiNT is not out yet
(and will probably never be), right?

Thanks for any piece of information (esp. ftp servers and path names :),
Marc

Atari cancled the Panther-project due to the fast development of the Jaguar
and its technical extensions (32 bit, lotsa colors, ect.). The Jaguar is
supposed to be a lot better than the Megadrive or Super Famicom. Sega will
also release a new console soon, called Gigadrive (how orginal).

As DD's readme states, it extracts a full copy of the file into it's working directory. So your program sees exactly the same file as it would without the DD stuff, albeit not on the same physical place.

It does make some noise during acesses. It's kinda hard to compare what I hear
to what you described, but why don't you go listen to one in a shop?
Seems to me that if this sound ment something bad, you would have found out in
these months.

No, that's no power surge. These are very short, the only thing you'd probably
notice when a power surge hits your machine is the smoke coming out of it...
You might have a problem with the internal power supply of the M30.

How *much* better, and what tests? I love my ST, but I don't believe
that it is as fast as a 16 Mhz 386sx. I'd be interested to see what
kinds of tests were done, and with what programs?

3919. Upgrading the ST: How far should I go, and is it worth it to me?

Newsgroup: comp.sys.atari.st
Date: 1991-11-04 22:17:54 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <JsRwaB2w164w@ersys.edmonton.ab.ca>
Source record: 227648

Hello, again.

I'm planning on upgrading my computer system withing the next month or two, and I have several options:

1. 1040STe w/4 MB RAM & AdSpeed STe
$1276.51 (Including INSTALLATION!)

2. Mega STe w/ 4 MB RAM
$1480.00 (Including INSTALLATION!)

3. Evil IBM alternative which I won't mention due to the fact that I can't reenjoy using Windows, and the price is awful (but lower than before).

If anyone could tell me the differences between the options #1 and #2 in terms of performance and worth, I would appreciate it. I know that the Mega STe has a new TOS and Desktop, and a non-attached keyboard. Does the 1040Ste also have a new TOS? I am using 1.4 now. I'd like the new Desktop, though, since installing icons on the Desktop is a good idea with a Hard Drive. If worse comes to worse, though, I suppose I could buy the DC Desktop or some other desktop which has this feature. 4 MEGS of RAM would give me a *whole bunch* of room to expand. My current system is a 520ST w/ 1 MEG RAM. Nothing special in terms of speed, and I use a monochrome monitor. Does the STe and the Mega STe allow the use of the SM124 monitor? I really like Monochrome, so buying a new monitor does not appeal to me at all. The systems I mentioned above do not ocme with the monitor. They are just the consoles.

Any help would be appreciated...

I'm having a little trouble with Sozobon and was hoping someone
could help:
Does ANYBODY have some Sozobon code that will find the
length of, allocate memory for, and then read in a text file? I
have ANSI compatible code that doesn't work no matter what I try.
Am I being a bonehead? Arg.
And is there a way to get past the limit of the number of
files Sozo will link? How can I write a big program if I can't link
more than ten or so files?

Message-ID: <1991Nov5.083905.28335@uokmax.ecn.uoknor.edu>
Source record: 227602

Is WFII a word processor of some sort? If so, then is it better than Word Writer ST? How much does it cost? Does it have a good manual?

I have LDW Power and it uses GDOS (I think). Will this FSM GDOS work with it? What did LDW use it for anyway? (Note: I've never done any thing other than use normal font for printing. Heck, I don't even know HOW to switch to another font. Oh yeah, I have a Panasonic KX-P1191 printer if that makes a diff.) All of this was probably explained somewhere in a manual, but *I* couldn't find it.

What other program(s) use GDOS? Will they work with FSM?

Please, inform the uninformed so that they may educate others in the ways of Atari! :) (This comment evolved from an earlier post about Atari Fanatics and their Religion.)

Thanks (again. Darn it all, I've posted 2 articles this semester asking for help or info. Or is it three? I've got to cut down before I become a Bandwidth Glutton. I mean, I'm already WIDE enough, right?)

Kenneth Love

[warwick]
>The Intel architecture is NOT a simple architecture. That's what makes it
>so slow. Where a 680x0 has one continuous expanse of memory, the 386
>system would be using 64K chunks, adding base registers and all that stuff.
>(The 386 is CAPABLE of running with continuous memory, but the OS generally
>isn't). These figures do not suprise me at all. 16MHz 386 is probably
>around the power of a 8MHz 68000.

I find it a bit difficult to believe that 8MHz 68000 = 16MHz 386.
8MHz 68000 ST system = 16MHz 386 msdos system, maybe.

I've looked at the subject before, and my conclusion was that a 68000
pretty much equals a 386SX (when running at the same clock frequency).
They're both 32bits processors with a 16bit databus, and they both have
the capability of addressing continuous memory. In the case where you
have two systems written _for_ on the a 8MHz 68000 and a 16MHz 386, and
not the case where the 386 is based on the obsolete msdos standard, my
guess would be that the 386 would outrun the 68000 easily.

What makes the 68000 as fast as the 386 is the pc-architecture. The
pc architecture is possibly the most outdated system architecture still
in use (not counting the C64). Memory segmentation, the need of downwards
compatibility with 8088 (fortunately they're getting over this) etc. etc.

The '040 is capable of an overall performance of 1.3 instructions per
clock cycle, versus the 486's 1.7 instructions per clock cycle. Then
again you have to consider the risc factor; how much does each instruction
perform? All in all, my guess would be that the '040 would run at least
twice as fast as a 486 at the same frequency. And if you'd put the 486
in a pc (after all, no sane computer engineer would even consider the
x86 processors unless they'd want to keep the system msdos compatible),
the difference would be even greater.

[warwick]
>Did you know that the screen memory on a 386 runs about 1/5 the speed of
>normal memory? And I thought the TT was slow with video memory!!!!

And, did you know that the msdos architecture doesn't allow more that 64KB
vram? They have to do bankswitching to get more than 64KB... >;-)
Also, the vram is not relocatable as on the ST... That's why pc's never
could beat Mac's/ST's/Amiga's on handling graphics. Just take a look
at Windows. That should convince even the worst diehard pc-freaks.

If all pc-systems blacked out tomorrow, I couldn't care less.

3928. Indus GTS-100 floppy drive

Newsgroup: comp.sys.atari.st
Date: 1991-11-05 20:56:48 UTC
From: boyd@pi.cs.fsu.edu
Message-ID: <1991Nov5.155648.14058@mailer.cc.fsu.edu>
Source record: 227609

Howdy,

I have a been offered a GTS-100 for a song. However, it (like its brethren) does not seem to work quite right. When I connect it to my Mega2, it not only refuses to format in twisted mode, it also somehow prevents my internal floppy from doing it! My questions are:

1. What exactly is wrong with this drive (ie what does it do wrong).

2. Is there any way I can disable or fix the "wrongness"?

I remember this thread from years past, but time has clouded my memory. I want the drive to work with my system (obviously), be able to format out to at least 82 tracks 10 sector/track, and be able to twist format. I assume there is something non-standard with the Indus board in the drive, and not the drive mech itself. If the problem cannot be "fixed", what I propose to do is disconnect the drive cable from the Indus board, hook it directly to the drive mech, and use the Indus board only for power. This would cause me to loose the little LED track display, but I could live with that. This brings me to two more questions (given that the answer to #2 is "no"):

3. The 3.5" drive mech inside the Indus is a Shugart SA310-16.
Will this drive work properly with the ST, without media change detection problems?

4. What are the correct pinouts for directly connecting a floppy to an ST cable? Is there a text file somewhere that tells how to hook a generic 3.5" floppy mech to the ST?

Any information would be appreciated. Please email, and I will post a summary if there is interest.

Hang on! We should put this into perspective:

I'd like to say that the thing that has remained constant about Double Click Software is their support after I bought DC Data Diet. I had problems with the program, they explained why things were the way they were, and the problem was solved. They didn't have to answer my questions in public, but they did. I think everyone has gotten a little too angry about this. Mr. Vederman wasn't too professional in his response, but so what? Everyone gets angry at one point or another. When I was having problems with Data Diet, much of what I said was less than courteous. I guess the point is just to relax. If Mr. Vederman chooses to put himself out of business, or stop making free programs, let him. There isn't a law that says he has to make programs or else...:)

The bad news here in Toronto, Canada is that Digidesign has indeed
discontinued Sound Tools for the ST. The newer MegaSTe and TT were
to have different external card interface slots and Digidesign got fed
up and didn't want to design another card, since they already had
one for the Mega2/4 machines.

I remember being incredibly impressed last year when I got a demo on
Sound Tools for the ST. By the time I was ready to buy the system,
Digidesign stopped distribution and all the stores here were sold out.
I have had the MAC version of Sound Tools for 2 months and holy mackeral
I am very impressed. I can't remember if there were any glaring
differences between the Atari and Mac version, but I would think that
my MACIIcx runs the system faster than my Mega4 could have.

Lemmings is getting rave reviews from all kinds of magazines, so I think
your money will be well spent. I do not know of a demo in the public domain.

Hmmm, any C compiler that could handle Turbo Pascal code wouldn't be good,
it would be magic.

You might try gcc, from atari.archive.umich.edu. If it does not fit your
needs, I happen to know that Prospero C is a great product. It will cost
you about $100, but the docs alone are worth it (and the compiler is rock
solid).

No, but I can't imagine why you'd need them. To write GEM applications
with Sozobon C, you need the GEMFAST libraries, which are available at
atari.archive.umich.edu. GEMFAST.H includes all the usual GEM object
definitions, constants, etc.

.... stuff deleted

This is really great. It's time to switch to MiNT full time. Even the
GNU Emacs 18.55 port from Edgar Roeder works. On prior MiNT versions
this port alway aborted with a Fatal Signal 14.

Now, I'm hoping, that this version will also be running on TOS 2.06
and the SST 68030 from Gadgets by Small.

If you are using the GEMFAST libraries then they are combined into GEMFAST.H.
Get the latest version of GEMFAST from the atari archive.

3943. Help Unarchiving

Newsgroup: comp.sys.atari.st
Date: 1991-11-06 12:39:49 UTC
From: peterw@spider.co.uk
Message-ID: <1991Nov6.123949.9313@spider.co.uk>
Source record: 227625

I'm having a problem unarcing some archives that I have.
I hope so kind soul can give me some assistance.

This is what I've done so far:

1) Got archive program arc.ttp
2) Got archive eg XYZ.arc
3) Used atob on a unix box here on arc.ttp and XYZ.arc.
4) Transfer them to 3 1/2" discs by putting them onto a dos box using binary mode ftp

So far so good

5) ST "sees" the files ok
6) Ran arc.ttp specifying XYZ.arc as the argument.
The arc program seems to run ok.
7) After a few seconds the gem window re-appears - alas no new unarced files
8) Enter state of severe depression
9) Go to pub!

Any ideas what is going wrong? Have I missed a step in the process or am I just having brain failure?

Any help (by e-mail preferably) will be very much appreciated.

Thanks,
Peter.

Hello !

I don't know any hp2392 emulator on ATARI ST. But on IBM PC no problem : you have the "ADVANCE LINK" software sold by Hewlett-Packard. It works fine and there is also a version for MS/WINDOWS (product number is D2104B).

I guess that you can find it where ever you can find HP PC distributor.

3946. Re: Spectre 128 and System X.X.X ?

Newsgroup: comp.sys.atari.st
Date: 1991-11-06 13:29:57 UTC
From: longj@lonex.rl.af.mil
Message-ID: <1991Nov6.132957.12757@lonex.rl.af.mil>
Source record: 227614

Just to summarize the Spectre OS question. I was originally warned that
6.0.7 was not too stable on the Spectre. So, when I tried to d/l the 6.0.7
software and couldn't get a successful install, I assumed it must be 6.0.7's
fault.

Hence my (now outdated) quest for 6.0.5.

I examined my system folder and found a previously unseen (ok, I missed it!)
startup Init (an anti-virus) that was causing the install to break. Yes,
they warn you about Inits in the opening screen of the System Installer,
but I didn't remember seeing on in my folder so I assumed the 6.0.7 was incompatable.

To make a long story short (or is it too late for that?)...I got the
6.0.7 disk images from apple.com , un binhexed and un-sitted (sp?) them and
then loaded the disk images directly using MountImage. I was then able to
do a complete and successful install on my Spectre 128, sys 3.0!!

Thanks to all those who responed to my original posting (most of them telling
me I was wrong....which I was!).

Source record: 227623

I have an SX212 Atari modem (Hayes compatible, I think) and Flash! software. I haven't tried this yet, but I want to contact a site that answers, hangs up and then dials back (one way to have some form of security, since the remote modem must know my phone number beforehand).

Anyone know what I must do to get Flash to do this for me relatively easily.

I hoped that asking here would make it faster than walking the problem at home:-) (since I'm sure someone out there does this, too).

Have fun! - Bob

>that I can't get for my ST/TT (when I get my TT.)

For what it's worth...the 640K limit on 80X86 machines is an MS-DOS limitation, not a limitation of the hardware. There are MANY programs that you can run to overcome this limit and there are several other choices of OS you can run that eliminate the problem as well. So your problem is not with the hardware, it is with your OS and/or the software you are using. If you'll poke around the ibm groups for a while you will be able to sort out what you need to get your 386 machine screaming along.

Cheers,

Chris

>
>Chew on that awhile.

This is absolute bullsh*t. I can only think of one reason that a 386 or 386sx machine would LOOK slower than an 8 or 16mhz 68000, and that would stem from the use of Windows on the Pc side. I find it terribly amusing that there are still a few Atari cheerleaders around who have had their head in the sand long enough to believe that a 68000-based dinosaur is remotely comparable to a 32-bit open architecture system. This may have been true when PC's were using 8088 and 80286-8mhz chips and using Hercules monochrome graphics, but the fact is that you can get better graphics at a lower price on any PC clone these days. You can get cheaper hard disks, cheaper RAM and most importantly you can get thousands of well written SOFTWARE off the shelf. This includes many different operating systems written by professional developers so you don't have to depend on the manufacturer's shoddy ROM chips or some usenet hacker. I can think of three different versions of System V unix for the PC that you can go out and buy now and if you must have GEM, you can even have that too.

BTW, you can now buy a 486-50mhz clone decked out with a large (200mb+) hard disk, 8mb RAM, and 1024X768 color graphics for about $3000+change. This machine will crank out about 20 million instructions per second and you have a virtually unlimited supply of 3rd party companies that will supply any hardware need you can imagine which will pop neatly into one of the many open slots you have available.

Ultimately, the market will decide if the Atari machines deserve to live. Take one look at how investor confidence in Atari stock and you should get a prelude of what is to come.

Keep dreaming...

Cheers,

Chris

>---

Well, to find the size, or length of a file, just do an fseek with a
code of 2. For example:

```
fseek(file_handle, 0L, 2); /* Seeks to end of file_handle */
```

After you do that, you ftell() the number to get the length of the file.

```
length_of_file=ftell(file_handle);
```

Thats the portable and simple way of getting the length of a file.

BUT if you insist on being sadistic you could use the dma record with
fsnext calls to fiure it out too.

And as always, BE careful to declare your function ftell to return a long,
and the correct type for "length_of_file" should match the return type
of ftell....(DAAAAA). Like so:

```
FILE file_handle;
long ftell();
long length_of_file;
```

OK? If I did anything wrong, I am sure someone will post the correction
but I think that is about right.

Sozobon won't let you link more than 10 files?! EGADS! That sucks!
But then again, thats Public Domain too I suppose.

I've not seen a demo for the ST, but I have the game, I don't think you'll be disappointed. The graphics are very well done, no flicker, mouse control is quite good. If you have an unclear monitor (composite or RF) some of the icons are a bit small, but they can be figured out.

It's impossible to see what you did wrong if you don't provide an example. There are pitfalls, discussed below.

> And is there a way to get past the limit of the number of
> files Sozo will link? How can I write a big program if I can't link
> more than ten or so files?

The linker will read a list of filenames from a file. You also can put the files into a library and include it on the command line. I just recompiled MicroEMACS using the latter method. See the documentation for ld.ttp and ar.ttp.

Now, back to the first question.

Sozobon (actually dlibs) includes all the necessary ANSI-conformant functions to obtain a file size, allocate memory, and read the data.

There's a problem that you're likely to run into if you're working with large files.

ANSI specifies:

fread(char *data, unsigned size, unsigned count, FILE *fp)

Note that ``count'' and ``size'' are objects of type unsigned int. They are not long values. If you're reading objects where size == sizeof(char), then fread can deal with a maximum file size of only UINT_MAX, or 64K with a compiler that uses 16-bit integers.

I just looked at the dlibs sources, and fread() is implemented with int (not unsigned) arguments. This limits you to 32K. I think this is a bug, but it doesn't really make any difference, since both 32K and 64K are too small.

If you must use the ANSI fread function to get the data, you can work around this problem by reading the data in more than one gulp.

Another approach is to use the Un*x-compatible, unbuffered open/lread/lwrite functions from the library (see below) or the GEMDOS Fopen/Fread/ Fwrite macros that do pretty much the same thing. They will read/write long values.

Cut here 0/
----------0\----------

```
/*
* bonehead.c
* demonstration of reading and writing with unbuffered i/o
*/

#include <stdio.h>
#include <malloc.h> /* declare malloc, lalloc, et al */
#include <fcntl.h> /* constants used by open() */

main(argc,argv)
int argc;
char *argv[];
{

/*
* Declare local variables.
*/
long filesize; /* note this is a LONG, not an INT */
long bytes_read;
int fd; /* file descriptor returned by open() */
char *buffer;

/*
* Get the file size. fsize() is declared in stdio.h.
* A returned value of -1 indicates that the file cannot
* be accessed.
*/
filesize = fsize(argv[1]);
if (filesize < 0)
{
printf("Can't access file %s!\n",argv[1]);
exit(-1);
}

/*
* Allocate a buffer to hold the file. Note that we're
* dealing with a file size potentially larger than can be
* obtained from malloc, so we have to use lalloc.
```

```
*/
buffer = lalloc(filesize);
if (buffer == NULL)
{
printf("Can't allocate %ld bytes of memory!\n",filesize);
exit(-1);
}

/*
* Open the file. Note that no CRLF->LF translation will be
* performed by any of the open/read/write family. But
* the same would be true if we were using the buffered i/o
* family (fread, fwrite), because text file translations
* are performed only when reading a line at a time. See
* dlibs.doc for an explanation.
*/
fd = open(argv[1], O_RDONLY);
if (fd < -3)
{
printf("Can't open file %s!\n",argv[1]);
exit(-1);
}

/*
* Read the file into the buffer. Note that lread() returns
* the number of bytes actually read; if the numbers don't
* match, we have an error.
*/
bytes_read = lread(fd, buffer, filesize);
if (filesize != bytes_read)
{
printf("Read error on %s: Asked for %ld, got %ld\n,");
close(fd);
free(buffer);
exit(-1);
}

/*
* Now we have the entire file in memory. For demonstration
* purposes, we'll just blast it at the screen.
*/
lwrite(fileno(stdout), buffer, filesize);

/*
* Clean up and exit.
*/
close(fd);
free(buffer);
exit(0);
}
```

> I'm looking for a C compiler for the ST. Which one is good?
>
> I'd really like one that is PD and/or one that would accept stuff
> from Turbo Pascal (IBM ports)...

The free C compilers for the ST are GCC from the Free Software Foundation and Sozobon C from Sozobon, Ltd. Both are available by anonymous FTP from atari.archive.umich.edu or via mail server from atari@atari.archive.umich.edu (send a message containing the word ``help''). GCC requires 2MB of RAM and lots of hard disk space. Sozobon will run on a smaller system with floppy drives, but it is K&R C (with extensions) and not ANSI C.

No C compiler is going to accept Pascal code. If you're looking to rewrite software that uses Turbo Pascal graphic routines, I think the commercial Turbo C (recently renamed Pure C) may support the Borland Graphics Interface, which would provide an element of familiarity. However, it costs a chunk of money and is available only with documentation in German. And if you're going to rewrite the code anyway, you really should use GEM directly.

I have not kept up with the Atari world for at least the past year.

At this point, I would like to purchase a product which will enable me to run IBM-PC/AT/386(?) compatible software on my Atari 1040ST. I know that several products/software existed for this purpose, but I don't know what are the best options available today.

Any info would be greatly appreciated. Please respond via E-mail.

In <9111060140.AA11989@cwns10.INS.CWRU.Edu> an630@cleveland.Freenet.Edu (Miguel Borges) writes:

>What is this SPACOLA.LZH file on the atari archive? I can't get it to
>do anything.
>It runs O.k., looks pretty good in mono - but I can't figure out what
>to do. The instructions are in German, I think. Somebody wanna make up
>some English docs?

Personally, I'm getting pretty fed up with this stuff. OXYD didn't work. OXYD2 didn't work. SPACOLA didn't work. All are 700K files.

They don't seem to work on foreign machines. If Bolo and Esprit are any indication, these games are EXCELLENT. I would send away for the Dongle if only I could believe they would then work. But I doubt it. They are supposed to be playable for the first few levels to give you a "feel" for the game, then you buy the Dongle to play the rest of it. Great idea, really, but it seems the hack-protection code is just a little bit pedantic (it probably thinks non-German TOS is a hacking ROM or something). I've tried with non hard disk, booting from the floppy and everything, none of the programs would work.

I just wish I had an email address for the distributors, then I could tell them, get a fresh copy and probably buy the Dongle.

frustrated,
Warwick.

I've got a copy of GST C sitting gathering dust. ;-)
It was a weird C written by GST to do First Word, and they didn't put in
floating point support, and a few other less needed features.
Should Megamax(original version), and Laser C count as 2? They were
fairly different.

```
RR>
RR> These must have ad hoc and heavily biased "benchmarks".
RR>
RR> Using the most widely-accepted benchmark of non-floating-point
RR> performance, the dhrystone test, a 1040 ST gets about 700
RR> dhrystones/sec, while a 386DX-33 has a best-case (small model)
RR> performance of a little over 13000 dhrystones/sec, and worst-case
RR> (large model) of about 8000. (These figures have been widely
RR> reported, and I have confirmed them myself). A 386SX-16 should get
RR> 16/33rds of the 386DX-33's performance (although I have not
RR> empirically confirmed this).
RR>
WRONG...
Wrong for a number of reasons...
Realize all the 386dx-33's "I" have seen have had caches of atleast 32k...
(I have both an ST and a '386dx-25)
Not only that but the DX has a 32 bit buss and the SX has a 16 bit buss..
Due to the difference in the buss's it definetly is not a 16/33 split...
More like a 1/4 split.. Not to mention the Cache that can DRASTICALLY speed up
lots of benchmarks and such.. I am assuming from your numbers that the dx-33
your using definetly has a cache..
It has been well known for quite a while that a standard ST was equal to a hot
dog '286-16 clone.. (I have seen this comparison in many magazines and such...)
I have read that essentially a '286-20 can compare dirrectly to a '386sx-16.
That was why I purchased this '386dx-25 when I did....
I do not doubt that the ST is almost equal to a '386sx-16 but I cant believe
its better (Unless you hook up VGA and try to do graphics....)
Although I do not know for sure...
A 16mhz Mega STe should be able to compare to a '386sx-20 or even a '386dx-25
when you enable to cache...
(Putting my neck out on a limb.. Although I have been using an ST and a '386dx-
25 for quite some time now...)

jph@minster.york.ac.uk writes:

|On the continuing subject of software development tools for the ST I have a
|suggestion - would there be any interest in a tool for developing context
|sensitive "Hypertext"-style Help systems for the ST for any GEM programs [...]

A German program like this exists, from a company called Sigma-soft. I
haven't used it much. It looks like it's inteded to be used as a DA,
and has a couple different protocols for communicating with applications.

For PageOMat, which is now shipping with FSMGDOS, I wrote a very simple
hypertext-style help system. I designed PageOMat help so that it will
eventually be usable as a standalone help facility. Example source
code will be made available to developers in a few months (after I get
a chance to catch my breath and spend a few weeks very far away from
any computers ;).

Antic had a CAD-3D Design Disk that focused on floor
plans / architecture, so if you can scrape up CAD-3D 2.0 from a
bargain bin (plus the design disk), you'd be all set. You also
might look at Easy Draw - it's a good product, and it's being
actively supported by Migraph (although you probably won't find it
in the bargain barrel!)

Message-ID: <1991Nov7.055433.16213@usenet.ins.cwru.edu>
Source record: 227652

So what do you all think Atari is planning...

the last time Atari sat still like this for a year is when they released
the Atari ST and XE computer systems back in 1984 or was it 85?

I've heard several rumors Atari is redesigning all of their computers.

Some of the rumors have it that they will include enhanced graphics and sound
with a multi-tasking operating system.

The Mega STe is supposely being redesigned with a 68020 chip.

I don't know folks... I do know that it looks like the calm before the storm.

I've been around the Atari community for a long time and like I said, I haven't
seen Atari play dead like this since the ST was introduced and shocked half
the computer industry.

> Where and how do I connect this little thing, when I am
>installing a 16MHz 68000 accelerator to my Mega???

If you have HyperCache from pro-VME then you just put it in your spare-parts bin. It is no longer needed because its functionality has been replaced by some extra logic on the HyperCache board.

>To the matching pins of the new CPU? To the same points as it was with
>the old CPU? Something else?

If the extra board is still needed with some other accelerator board, I would suggest mounting it underneath the accelerator board, connected to the same points. Install a pair of strip connectors instead of an ordinary socket if you need to make extra space under the accelerator board.

> BTW, what does this funny little thing do? A correction to
>some nasty lay-out error?

As far as I remember, it corrects a timing error to do with the Blitter chip, presumably older Mega STs should have the extra board retrofitted to avoid this error.

3982. GNU Tar v1.10

Newsgroup: comp.sys.atari.st
Date: 1991-11-07 11:32:09 UTC
From: alanh@logitek.co.uk
Message-ID: <alanh.689513529@krypton>
Source record: 227680

Hi,

Well, I've recompiled my port of GNU Tar v1.10 with patchlevel 14 of
the MiNT libraries and now it should support symbolic links when used with
MiNT v0.9. I've had no way to test this yet, so if anybody has problems,
please tell me about them.

I've sent both sources and binaries off to Graham Higgins, who should
be uploading them to A.A pretty soon. Maybe cross posting to c.b.a.st and
c.s.a.st too.

I've just laid my hands on Paul Moreau's code for accessing SCSI
tapes through Tar, so when I get chance I am going to incorporate it into
GNU Tar v1.10.

I haven't tested this version at all with MiNT v0.9 as I haven't laid
my hands on a copy of MiNT v0.9 yet. But I have tested it successfully under
MiNT v0.8.

Let me know how it all goes if anybody uses it.......

Alan Hourihane

Actually it is not a hardware dongle you can put in some port and play
the higher levels. It is rather a book which contains some vital
information to help or even enable (?) you to solve the higher levels.

I heard about OXYD/SPACOLA not running with foreign TOSes before so
this really seams to be a problem. Unfortunately Meinolf (the author)
doesn't have net access.

Well, why look a gift horse in the mouth, eh? I just wrote another program which, instead of resetting shiftmode to restore the 640x400 screen, resets line-A variables for a 1280x200 display. Unfortunately, the GEM desktop doesn't seem to like this. If I run this program in my AUTO folder I get bombs when the desktop tries to come up. If I wait and run from Gulam then Gulam works, but the desktop is still screwed up. Right now I'm using te in gulam to login and post this article...

Two things - how do I get the GEM desktop to use the 8x8 font when it booted up in monochrome, and why is it crashing? I've set v_rez_vt, v_rez_hz, WKXRez, WKYRez, bytes_per_line, width, v_cel_my, v_cel_mx, v_cel_wr (text in TOS mode works fine...), what am I missing?

I asked this question on .tech with no (useful) answers. Maybe someone here can help.

What types of simms does one use in the TT? I could use model numbers, specs, appearance, anything. I just need descriptions.

You see, I have access to some 4megabyte simms right now, but I don't know if they'll fit into a TT. I probably won't have this access by the time I GET a TT. So if these are useful, I'll need to snag them now.

I managed to get hold of a copy of the new TOS on floppy from a friend who knows a friend which workd fine on my 2mb STe. However, it eats up space, requiring around half a meg. Of course this isn't a problem for me but it might be for 1mb and 512k owners.

By the way, I've installed it onto my hard disk and it's just soooo lovely... All those wonderful options and keyboard shortcuts - ah! bliss bliss bliss

(Before you ask, I can't remember the TOS version, but it's the TT one 'cos on screen preferences it has slots for ST low, medium and high and TT low, m & h.)

A very happy STe Owner.

>Wrong for a number of reasons...
>Realize all the 386dx-33's "I" have seen have had caches of atleast 32k...
>(I have both an ST and a '386dx-25)

This is true but irrelevant to the 386 vs. ST controversy. The cache does not in any way speed up the CPU: it just uncouples it from slow system RAM. Note that you could do away with the cache if you put 25ns RAM everywhere in the system (this would actually *improve* performance). Caches are popular because the price of a cache controller + 64Kb of 25ns RAM + say 4MB of 70ns RAM is much less than the price of 4MB of 25ns RAM.

>Not only that but the DX has a 32 bit buss and the SX has a 16 bit buss..
>Due to the difference in the buss's it definetly is not a 16/33 split...
>More like a 1/4 split

No. For a CPU benchmark like Dhrystone, bus speed is not a very big factor.

3990. Atari MEGA 2 for Sale

Newsgroup: comp.sys.atari.st
Date: 1991-11-07 14:48:01 UTC
From: jcl7452@rouge.usl.edu
Message-ID: <1991Nov7.144801.26947@usl.edu>
Source record: 227676

I hope this hasn't been posted yet, I've had trouble posting
lately. Sorry if this has already been posted.

FOR SALE
Atari Mega 2 - with new 720k internal floppy
SC1224 Color monitor
Golden Image mouse
Epxy 500xy joystick
Atari SMM804 dot matrix printer (broken, paper won't advance)

Software
Timeworks desktop publisher
Degas Elite
1st word plus
Spectrum
Masterplan (spreadsheet)
Uniterm (most recent version)

GAMES
Gauntlet
Chessmaster 2000
Dungeonmaster
Gunship
Leisure Suit Larry II
Leaderboard Golf
Invasion
Shanghai
and many other public domain/shareware games (HACK/Asteroids/etc.)

I also have old STart disks and magazines. I have 32 disks from Spring
1988 through February 1991. I think the set is complete with magazines.
In addition, I have the last 2 years of Current Notes Magazine.

ASKING PRICE (for everything) $600 (buyer pays shipping)

This systems has not had a lot of use. I recently replaced the defective
internal floppy and had the serial port repaired (an electrical storm
killed my modem and damaged the serial port) at L&Y electronics in the
Washington DC area. I still have the original boxes.

I'd like to sell it as a set but I'll break it up if there are not offers
for the entire set.

Subject: TOS 2.06 AND 3.06 Conference: N-Atari-ST
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Information on TOS upgrades, pricing and procedures will follow
this announcement.

TOS 2.06 Upgrades - November 1, 1991

---> For MEGA STe, ST/STe*

* Atari ICON (Fuji) displayed at Boot.
* System memory check after a cold boot, pressing any key aborts test
to reduce attendant delay.
* A shrinking bar is displayed at boot, during hard disk intialization,
pressing any key aborts process and attendant delay.
* Pressing the Control key at boot bypasses autofolder preventing the
loading of .ACC, NEWDESK.INF and Deskicon.rsc files.
* Holding down the ALT key and typing a decimal number on the numeric
keypad inserts an ASCII code character into the keyboard buffer.
* Media Change detection on floppies works better, uses FAT checksums,
MS DOS 4.X serial numbers and many other features permitting superior
detection when a floppy has been changed.
* Less floppy spin-up delay in systems with a hard drive.
* Vacant drives detected sooner with quicker time-outs.
* Floppies with only one FAT are supported to allow greater
compatiblility with some DOS disk formatters.
* Serial Port functionality improved.
* Some programs that use Timer-A will work better (compatability
improvement).
* Multiple AES events when scrolling are reduced.

NOTE: TOS 2.06 for ST or MEGA ST requires hardware adaption,
Atari (Canada) will shortly announce the process for users
to upgrade. TOS 2.06 is available as an upgrade for STe
computers.

TOS 3.06 for the TT
-------------------
* High Density floppy supported.
* Atari ICON (Fuji) displayed at Boot.
* Boots up in 640x480 resolution, press ALT key when Fuji displayed
for 320x200 resolution.
```

* System memory check after a cold boot, pressing any key aborts test
to reduce attendant delay.
* A shrinking bar is displayed at boot, during hard disk intialization,
pressing any key aborts process and attendant delay.
* VDI improved for BITBLT operations.
* Pressing the Control key at boot bypasses autofolder preventing the
loading of .ACC, NEWDESK.INF and Deskicon.rsc files.
* Holding down the ALT key and typing a decimal number on the numeric
keypad inserts an ASCII code character into the keyboard buffer.
* Media Change detection on floppies works better, uses FAT checksums,
MS DOS 4.X serial numbers and many other features permitting
superior detection when a floppy has been changed.
* Less floppy spin-up delay in systems with a hard drive.
* Vacant drives detected sooner with quicker time-outs.
* Floppies with only one FAT are supported to allow greater
compatiblility with some DOS disk formatters.
* Serial Port functionality improved.
* The 68882 is now reset at boot time.
* Some programs that use Timer-A will work better (compatability
improvement).
* Multiple AES events when scrolling are reduced.

>
>Thanks, Jeff Long

I use system 6.0.7 with no problems. 6.0.5 is the best system around for the Spectre if you want sound, but 6.0.7 supports True Type. 7.0 does not work yet (Dave? Dave?). Actually, 7.0 is not much of an advantage unless you are networked anyway. What probably happened is you used the "Easy Install" with system 6.0.7 and it gave you "Mac+" system software. This will crash the Spectre (don't ask me why, it should work). Go under "Customize", and choose one of the selections for "System Software for All Macintosh Computers", or whatever it may say which happens to mean approximately the same thing. Contrary to popular belief, these selections do not just put in different Desk Accessories, Fonts, and CDEVS/INITS, but also produce a slightly different code (the Mac+ does not need all of the code since some of it was written specifically for different chip sets?). Anyway, installing 6.0.7 for a "Mac+" crashed every time I tried it, but "Any Mac" works just fine.

> floppy system?

Sure. MiNT will run on a 512K, 1 floppy system. Of course, you won't be able to do much on a minimal system :-). But with 1 meg of memory you should have enough left to be fairly comfortable.

As far as I know, most hard disk cache programs should work OK.
I use the one built into the ICD disk utilities all the time (indeed, I'm reckless enough to have turned on write caching, with no ill effects so far :-)).

Source record: 227669

I've never fooled with GDOS before, but now I've got Gemini and another application which uses GDOS - how do I go about "merging" the GEMSYS directories and the ASSIGN.SYS files?? Is there something special that needs to be done or do I just copy all the fonts from one GEMSYS to the other and merge the ASSIGN.SYS files with an editor (removing the extra PATH line)???

What is the most recent version of GDOS (besides the one thats supposedly coming out soon) and how can I get it - I have Version 1.1

4001. Source-level debuggers for C?

Newsgroup: comp.sys.atari.st
Date: 1991-11-07 18:16:21 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Nov7.181621.20688@chinet.chi.il.us>
Source record: 227677

I've kept TOS 1.2 (or 1.02 according to taste) on my Mega all this time because I like the combination of db (the Mark Williams Co. debugger) and csd (the source-level debugger from the same folks). With the upcoming availability of TOS 2.06 upgrades, I'm afraid it's going to be time to move on to a new C compiler. But having a source-level debugger available is now a "settled expectation" for me. The situation is reinforced by using Codeview on the PC (some of the most inadequate documentation ever, but a debugger that works at BOTH source and executable levels).
My Question:
What C compilers that are still supported have source-level debuggers available? Do any of them also work at executable level? Anyone have strong feelings about their quality?
Steve saj@chinet.chi.il.us

I'm not set up to do development on Atari (Sparc and 386 are enough, thank you very much), so I just grabbed the compiled copy from atari.archive (dhry.lzh in the utilities directory). There is no indication there of what compiler was used. Apparently it was not a very good one.

4003. AUX-status in ST

I recently acquired a copy of Mark Williams C version 3.06. I have scoured the manual to find out how to include in-line assembly code in the C source program, but cannot find any references to it.

Am I somehow missing the part of the manual that discusses it, or does the compiler not support in-line assembler? If you know how to do it or know that it isn't possible, I would appreciate hearing either way. Apologies if I have somehow missed the obvious.

Hi!

I'm planning on buying a Atari TT, and I am thinking of running it under OS/9
at least part of the time.

Does OS/9 for the TT exist?
Does anybody have experience with it?
Can it do nifty things like memory protection for processes?
Can I compile C stuff written for UNIX on it, especially the GNU stuff?
Any other comments?

If you'll email me your responses, I'll be happy to summarize to the net.

Tnx a lot in advance!

Source record: 227679

Permit me to throw in my two cents if I may...
I am currently an Atari 8 bit user (please no flames, we poor college students can't afford much) Anyhow, one person I know was thinking of developing a 8mHz 65816 motherboard that would run Atari 8 bit software. The 65816 is 6502 compatible but has a 16meg addressing range, improved instruction set and 16 bit registers. It's data bus is still 8 bits though. The important thing here is that the 65816 is a synchronous processor as opposed to the 680xx and the 80x86 being asynchronous. As a result, an 8 mHz 65816 will reportedly run as fast as a 22mHz 80x86 or 680xx.
I thought one further example of how cpu architectures can make a difference would help convince those who are skeptical.

This is a fascinating thread, and I hope to follow it as it progresses, and maybe even caputure it and show it to some PC weenies that always tell me an Atari isn't a real computer.

4007. Gnumake under Hisoft Craft shell

Newsgroup: comp.sys.atari.st
Date: 1991-11-07 22:48:57 UTC
From: dxper@dtek.chalmers.se
Message-ID: <6575@chalmers.se>
Source record: 227686
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just started using Gnumake in my system which I run under the Hisoft CRAFT shell. Previously I used the make which came with the shell, but unfourtunately I found it to be a not-so-good-version.

Gnumake seems to be working OK, but at some point I end up having a need to execute shell commands (most notably the "touch" command) but this is an internal function of the shell.

Is there anyone with inside knowledge about the Gnumake program which knows if it is possible to execute commands via the standard system() interface which CRAFT supports (which would then give me the full abilities of the shell without any hassles, hopefully)...

> Any information will be appreciated almost as much as the program itself :^)

Ok answering your questions. I wrote the program. I just finished version 1.6
I'm going to send a copy to ATARI@archive.umich.edu. The program is PD.
The first few versions were pretty rudimentary, I'm going to send you the new
version so that you can try it. I will like to get any comments, suggestions.
If there is another program that works better, I'ld like to hear about it.
Right now I've a pile of German articles here that I'm trying to decipher and
although the program helps alot, it doesn't do everything. (I only speak
English, French, Spanish and Portuguese).

If anybody else has some comments about the program I'ld like to hear them.

Thanx,
Carlos Varela

4009. using less.ttp as the Neodesk pager

Newsgroup: comp.sys.atari.st
Date: 1991-11-08 00:47:16 UTC
From: boyd@pipe.cs.fsu.edu
Message-ID: <1991Nov7.194716.587@mailer.cc.fsu.edu>
Source record: 227684

Boy, do I feel like a yutz. In a previous post, I stated my desire to find the source for less.ttp (not the MINT one), so I could hardcode in my favorite options for use as the Neodesk alternate page displayer. The reason for this was that Neodesk does not allow you to specify any options in the path to the pager program. Well, it was just pointed out to me that I can simply set the LESS environmental variable to whatever options I want, and less will automagically pick them up (environmental variable setting was one of the original things that prompted the creation of Neodesk, sheesh). Anyway, I now can use less in my favorite form to view files from the desktop. It takes three steps:

1. Create a copy of less.ttp, and rename it less.tos (this is to prevent Neodesk from popping up an argument dialog, less does not seem to care). If you use less with Gulam or such (as I do), this should be a separate copy.

2. Set the "alternate file viewer" to the full path to less.tos, under "set preferences", "paths" in Neodesk.

3. If you want any options, set the variable "LESS" to them under "environmental variables" in Neodesk.

That's all there is to it. The only thing I miss is the ability to hit "v" and fire up an editor (less reports "no shell!"), but I can live with that. It is so nice to have a file viewer I can search for stuff with (using the "/" directive)!

By the way, this is the less available from atari.archive in the file /atari/utilities/less.arc. There is also a less97.arc out there, but it is a MINT specific port.

I still want the source to this guy, to see if I can fix the "v" thing and also maybe to add "scroll up/down 1 page" commands via the two mouse buttons. If you have it (for this particular version of less, for the ST) let me know.

Also, I have a buddy that complains about not having a good pager program for his TT. We are going to test out less to see if it works on his system. I'll post the results.

Finally, thanks to the MITer that pointed out the existance of the LESS environmental variable (which is also right in the man page for less). There's nothing like missing the obvious . . . .

Source record: 227682
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've uploaded source code and binaries for version 3.1 of the GNU
file utilities to atari.archive.umich.edu, in the files
futilsrc.zoo and futilbin.zoo respectively. They run under both TOS
and MiNT, although without MiNT 0.9 chown, chgrp, and ln aren't
very useful :-).

>performance of a little over 13000 dhrystones/sec, and worst-case
>(large model) of about 8000. (These figures have been widely
>reported, and I have confirmed them myself). A 386SX-16 should get
>16/33rds of the 386DX-33's performance (although I have not
>empirically confirmed this).

some time ago (> 18 months) i posted dhrystone 2.1 (or 2.0) to c.b.a.st
and c.s.a.st. i am certain i included the sources, tho all i find on
terminator is a .ttp. this is bad since that ttp (if it is the one i
posted) was done with alcyon. like 800 d's (bad). a compiler like gcc
or lattice or turbo should do >2000 i believe. i can't find the source
(easily) so if someone has it, could u upload to atari.archive? there
should be no such thing as a dhrystone "executable" since (IMHO) this
bm is as much a test of the _compiler_ as the architecture, more,
perhaps. any dhrystone results (at least on computers with lots of
third party compilers - eg the ST) should always include the _compiler_
as part of the reported dhrystone results, preferably with version
and switch settings (eg "i got 2435 D with gcc 1.40 using gcc -O ...").
it also might not be a bad idea to be real explicit with the h/w
config as well (memory, tos rev, clock speed, disk, etc).

also, i think dhrystone, tho prolific, is a lousy bm today.

otherwise, i think richard is pretty much on the mark.

>All this is just another illustration of the perils of mass-market
>computers: people end up tossing around terms like "benchmark" without

Well, I just got a copy of Turbo C 2.03 and the docs are ALL in German.
Big surprise that, what?

Anyway, the package seems nice enough but I wish someone somewhere would
translate it to English.

I read on GEnie that the American distributor (Gribnif) said that it
won't be translated to English due to "legal resaons".

And yet they ask $275 for it!!

BTW, C Johnsons reports there are serious bugs in the TC2 GEM library
as well as the "mfree" function.

any other TC2 users out there? Can you confirm these bugs?

I ran it this morning, and my FTL Modula-2 version gets 1086 dhrystones/sec.
From this, I would guess gcc -O, or TurboC (yuck) could get 2000.

These two previous claims are easily bettered by Turbo C (now Pure C), which
gets around 1700 dhrystones/sec with registers enabled.

Message-ID: <bhwhelan.689598970@unix2.tcd.ie>
Source record: 227687
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am currently writing a 3D graphical rotation program in GFA Basic and I am having difficulty in creating flicker-free graphics. Does anyone know how to direct graphics commands to a memory location while the screen is displaying something else, and then copy the memory contents to screen and over-write the previous one. Or, is there a way of doing it through the TOS system commands available in GFA? Or am I looking in the wrong place all together?

Any help appreciated - e-mail me if you can.
Thanks in advance.

4021. Flight Simulator II v 1.01 WORKS on STe!!!!

Newsgroup: comp.sys.atari.st
Date: 1991-11-08 14:47:25 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <11316@vela.acs.oakland.edu>
Source record: 227486

I finally got my disk back from subLOGIC after three seperate exchanges
and lots of arguementative phone calls. If you have an STe and an older
version of Flight Simulator II that will only run demo mode on your new
machine, just be sure to include very specific instructions for the
gomers that are working down there.

Here is how things went for me:

Call #1 -
Me> Asked if new version is available
subLOGIC> Asked which version I had
Me> Nothing on disk, etc. to even let me know
subLOGIC> Read version information on first pull down menu
Me> (*angrily*) I can't even pull down menus - demo only!
Told them it was circa 1986
subLOGIC> Send disk, we will upgrade

Shipped disk with note: "Please bring up to date"
Recieved disk with note: "We can not seem to find anything wronge with your
disk so we are returning....."

Turned to Local BBS - tried to find a friend with a new version.
everyone had the same version as me

Call #2 -
Me> I am sending disk - please upgrade
subLOGIC> You must say that in a note with the disk, we get so many
Me> (*angrily*) I DID!!!!

Shipped disk with note: "Please upgrade my disk to the most current version"
Disk Returned (some files damaged I might add)
Note reading: "There are no versions newer than this..."

Call #3 -
Me> You mean to tell me you don't have anything to run on STe?
subLOGIC> We do not intend to come out with anything new for the ST's
at this time.

Turned to Internet - Get version 1.01 of FS II - it works

Call #4 -
Me> You can upgrade a ST program to a new STe version
subLOGIC> Really??
Me> Yes! Please give me version 1.01 when I send my
disk again - for the THIRD TIME!!!

Sent disk with a very detailed letter, copy of the last two exchanges and my receipt. I asked very specifically for a copy of Flight Simulator II version 1.01 for that Atari ST preferably on a bran new disk.

Finally got a new disk, with version 1.01, that works on my STe. Would like to go on an on, bit I want to go flying. Good luck to the rest of you in your dealings with the Buttheads down there.

Well, as far as I have been able to determine, there are only a few multiplayer games (Chess, for example) which are now part of GEnie*Basic services.

The Multi-player Games Bulletin Board has recently been added to GEnie*Basic services.

I will check further if there is interest.

The Mega STE has a 50 Mb hard drive built-in, you didn't mention if your 1040 price includes a hard drive of some sort. $200 for 50 Mb is a good deal the way I see it. BTW, installation of RAMs on a Mega STE consists of flipping open the hard drive cover and plugging them in, not exactly a tough job. My local dealer only buys 2 Mb Megas, then adds SIMMs for buyers who want 4 Mb.

>Does the STe and the Mega STe allow the use of
>the SM124 monitor?

Yes, they use the same monitors that the STs do.

After looking at this thread long enough, I don't think anyone has put it
more forcefully than Chris has.

The PC's 386/486 machines are actually vastly under rated machines simply
because they are stuck running DOS applications.

Thats all. If anybody tells you any different, they more than likely have
the Atari LOGO stuck up where the sun don't shine.

For those that don't know I can now tell that it is possible to cheat in this game on the ST as well. Just type $ when in the world view window.

It makes the game somewhat easier...!

Sounds great!

Are there any information about further bug fixes (SERPTCH etc.)? Allan?
Will the upgrade kit include a 1.44 floppy?

Bcostat checks to see whether the device is ready to accept data for
output. Bconstat checks to see whether the device has received
data that is waiting for you in the buffer.

There are other ways to check the aux port status, but the proper
place to discuss them is comp.sys.atari.st.tech.

You might try putting the line

SHELL=path_to_your_shell

in your makefiles. If your shell has special hooks for other programs to
ask a already running shell to execute commands for them, you would
half to hack the Gnumake sources and rebuild make.

As a side note, bash 1.10 is available on atari archive now and next
week, the gnu utilities (such as touch) will be made available. If you
want a truely unix-like environment (like long filenames and symbolic
links), I strongly recommend this setup.

> know how to direct graphics commands to a memory location while the
> screen is displaying something else, and then copy the memory contents
> to screen and over-write the previous one. Or, is there a way of doing
> it through the TOS system commands available in GFA? Or am I looking in
> the wrong place all together?

Look up Physbase(), Logbase() and Setscreen() in your GFA manual. If
they are not supported, Physbase() is xbios(2), Logbase() is xbios(3),
and Setscreen(l, p, r) is xbios(5, l, p, r).

The logical screen (l) is where output will be written. The physical
screen (p) is the one that is being displayed.

The technique is to obtain a screen's worth of memory, aligned on a
256-byte page. This memory must stay put -- you can't just declare
it in GFA, because GFA shuffles variables around to conserve memory.
So you need to understand GFA's Reserve keyword and how to call the
system Malloc function. You need to know how to adjust the address so
that it is evenly divisible by 256. And you need to know how much
memory to reserve, which is a minimum of 32000 bytes.

Malloc 32*1024, save that pointer for Mfree, and create a pointer to
the new screen by adding the saved pointer with the remainder of a
division by 256. The result will point to sufficient memory that is
properly aligned.

You then call Physbase to get the address of the physical screen,
which you save for later use. Logbase gets the address of the current
logical screen, which can be useful.

Setscreen lets you redirect the logical screen at your allocated
memory. Pass -1 as the resolution argument (r) so that the system
resolution is unchanged.

Now you can write to the background screen. Another Setscreen call
can make it the physical screen in an instant. No data need be copied.

Remember to restore the original physical and logical screen pointers
before your program terminates.

Further discussion of this should go to comp.sys.atari.st.tech.

Sorry, nope. Air Warrior still costs $6 per blood-curdling hour.
There's a multiplayer chess game in the Basic services, but that
doesn't quite have the same visceral appeal.

If AW were free, I'd be up all night every night.

Check the atari.archive terminal emulator section...back when I first bought my ST in 1985, someone from HP in Fort Collins wrote an HP terminal emulator. I never checked it out closely to see how good it was, but it is at least worth a look...I think it is called something like "hpterm.arc" (?) in the archive.

OXYD and SPACOLA works fine on my Mega2 with danish TOS. *NOT german*
There is some differences between Scandinavian/German TOS and US-TOS,
(like <ALT>+key for national char's) But I doubt that is the problem.

To get SPACOLA to start the game, you have to read the 'about dongleware'
when the main menu gets up. (or was it in OXYD2?)

In the interests of completeness, you might want to mention mjc (Mark Johnson's C) as well. :-)

Also, although a cursory inspection didn't find them at atari.archive, there have been pascal and fortran to C converters posted in one of the comp.sources groups (look for p2c and f2c). These have been ported to non-Unix platforms (eg MS-DOS) so I imagine they could be ported to the ST without too much effort. (Does anyone know of a port of these to the ST? If not, would anyone be interested in such a port?)

4043. Performance (was: 8mhz ST = 16mhz 386)

Newsgroup: comp.sys.atari.st
Date: 1991-11-08 20:38:18 UTC
From: daryl@cbnewsc.ATT.COM
Message-ID: <DARYL.91Nov8153818@cbnewsc.ATT.COM>
Source record: 227466

Here is some benchmark information from a fairly large application.
It is a real world project and represents better numbers than
synthetic benchmarks (IMHO :-).

The application is Spinnaker Plus; a Hypercard look alike that runs
on both Macs and PCs. All the tested machines have Quantum 105
disks, but the tests were run in such a way that the disk I/O
system was not used. (All the cards were forced into main memory.)

This test compares an ATARI STe 4MB with the ICD 16Mhz accelerator,
a MAC IIcx, and a 386/33 (128KB cache), Orchid Prodesigner II VGA,
running Windows 3.0. Obviously the Atari was running Spectre.

Test #1, show all cards with the screen lock on. The display is never
modified, but the application is forced to process all the cards.

```
Atari STe-16Mhz MAC IIcx PC 386/33
----------------------------------------
22 seconds 14 seconds 14 seconds
```

Test #2, show all cards and display them. The cards are very sparse
with very little graphics and 3-10 lines of text.

```
Atari STe-16Mhz MAC IIcx PC 386/33
----------------------------------------
58 seconds 30 seconds 150 seconds!
```

Facinating, huh?.....

Comments and corrections welcome. Flames to /dev/null

4044. hypertext help

Newsgroup: comp.sys.atari.st
Date: 1991-11-08 21:27:33 UTC
From: herb.chong@channel1.com
Message-ID: <19918.1134.982@channel1>
Source record: 227468

JP=>On the continuing subject of software development tools for the ST I have a
=>suggestion - would there be any interest in a tool for developing context
=>sensitive "Hypertext"-style Help systems for the ST for any GEM programs [in
=>roughly the same style as the Windows Help system on the PCs]. The advantage
=>of such a tool would be that (if it and its standards were adopted) there wo
=>be a consistant method of obtaining help from any standard GEM program - muc
=>as GEM provides a standard environment for selecting files etc.

JP=>The (proposed) kit would contain :

JP=> a) an interactive editor for creating hypertext help documents
=> b) a "shell application" module in the form of
=> functions for C/Pascal etc. to access the help, to be linked in
=> (with minimal pains) with existing program code; or, preferably
=> to form a starting prototype for the envisaged system.
=> c) a standard resource file to hold the help resources

i have one i wrote which is more than half finished. no-one wants to
license it. i'm not willing to give it away. the Help program itself is
a desk accessory that accepts user AES messages. this allows complete
implementation of context sensitive help and hypertext help from within
any GEM program. it does smart caching and remembers help files between
calls to an app so that it doesn't rebuild the help index each time. the
Help files are specially tagged ASCII files that format on the fly and
allow arbitrary screen sizes. when read in for the first time, an index
and table of contents are built. no resource file is needed or used, and
imbedded bitmaps or GEM files are allowed. when a user application needs
to do help on the topic, it sends an AES user message to the application
HELP with the HELPFILE to search and the topic to display. if the
HELPFILE isn't found, the HELPFILE file open dialog box is displayed. if
the HELPFILE is found but the topic isn't, the index or the table of
contents is displayed.

you are welcome to write your own, but i have done it a large part of it
already and no-one wants to pay $1 per copy as a license fee.

Has anyone else had trouble with the MiNT port of KSH unter MiNT 0.9?
It simply stopped working when I installed the new MiNT; it kept
trying to run everything in the background (as if I had typed an "&"
following every command.) I switched to BASH in the meantime but I'm
curious to know if anyone else had this problem, or if it's just me,
and if ggascoigne (sp?) intends to upgrade KSH or release his source
code.

Beware that some programs compiled under older versions of MiNT to
operate in CBREAK input mode may need to be re-compiled to read using
RAW mode, due to the new tty handling in version 0.9. I ran into this
problem with my port of JOVE (which will be posted on atari.archive as
soon as I get shell mode working, which should be possible now that
Fselect is working properly.)

This isn't quite true. The 640k limit was imposed by hardware in the original PCs. They have something like a 1Meg address space, and the reste was reserved for cards, including video.

Several people have posted about prices for the STacy.They claim that the machine costs such and such new, etc.. While there may be some dealers who bought a number of machines, and then were not able to move many because the ST market just was not ready to support a laptop, and so now have to take a huge loss on the machines in order to shift them, I do not feel that this is the general situation, and can not really take this into account. Once these bargains are gone, they will not be seen again. Also, they may feel they have to move these machines to make room for the ST book. At first this may drive STacy prices down, but when they become hard to find, and people realize that there is no cartridge port on the Book, and so the GCR won't work, that the STacy has a MEGA expansion port, and so works with monitor cards and the MEGA Talk board, and that the book has no back light, the prices of Stacy's will not be so low. I paid $2400 a year and a half ago for my machine, and want to make some of it back. Many people quoted the price of a STacy 2. Well, the price of the Stacy 4 is much more than the 2, not just the difference in memory price, thanks to Atari "engineering". I guess, what it comes down to is that IMHO i do not feel I was being that unreasonable. If others think so, and can get these deals, they are free to do so. So it goes. I am not holding a gun to anyones head. Personally, I think that it is a pretty good price for what you are getting. Maybe I am wrong. But you might as well send the response mail to me, and not to the net, as I may have sold it. If not, then yell at me for my next post! :)

Source record: 227561

In article <1991Nov6.160344.21699@msb.com> ritz@msb.com (Chris Mauritz) writes:
>BTW, you can now buy a 486-50mhz clone decked out with a large (200mb+)
>hard disk, 8mb RAM, and 1024X768 color graphics for about $3000+change.

Is 200mb considered large these days. The puney work-station (PS/2 Model 80
with 12Mbytes RAM) had only 320Mbytes of disk space and I was very pressured
for space. I would think that I would say a 1 to 2 gigabyte disk is a large
hard disk.

I also don't necessarily agree with Chris Mauritz that there is so much
support and quality software for the Intel 80486 architecture. I don't
usually see lots of support for many AIX or SCO UNIX or other UNIX programs.
Basing all comparisons on one operating system for the 80486 is bad.
While DOS is probably good for the average user, so is TOS. But Chris
is making the comparison based on excellent performance. If you put
UNIX on a 68000 machine, you get better performance than UNIX on a
Intel 80286 machine. The same goes for the Motorola counterparts to the
80386 and 80486 CPUs.

If I was going to invest $3000 in a computer system, I would put some device
on it that would electrically shock any person attempting to run DOS or
a DOS based program on it.

Well, the floppy disk controller chip has died on my old faithful ST, and I am in desperate need of a replacement IC, WD1772. Does anyone know where I can obtain one? This fairly urgent, as my computer is crippled right now and I need it fixed ASAP. If anyone can help, please e-mail.

THanks a lot..

Jeff Mayzurk

Source record: 227481
Cross-posted to: comp.sys.atari.st,news.newusers.questions

Hi.. I need a program to (at least) receive news from a local
computer. I have an Atari 520 ST (w/ 0.5 meg, none added!). It doesn't
have to be fancy, and probably won't be, if it has to fit on my 520.. I
have no hard drive, I do have a double sided drive. If anyone knows of
any small program I can use, or anything else.
And if anyone is knowledgable on the subject, please tell me:
How long would it take to get, say, 5 newsgroups at 2400 baud with mnp5,
etc? And how hard is it to set up such an arrangement to get news off of
a university or other computer? Thanks in advance!! :)

In <1991Nov7.170451.2991@sae.com>, Bob Malay writes:

>Is there something special that needs to be done or do I just copy all the
>fonts from one GEMSYS to the other and merge the ASSIGN.SYS files with an
>editor (removing the extra PATH line)???
Hmm, it's not that easy. Every ASSIGN.SYS file consists of blocks defining
the font available for a certain resolution/output device. If you just merge
the two files, it would look like this:

```
01p screen.sys
; long list of fonts from application #1
;
; long list of other resolutions/output devices and their fonts deleted
01p screen.sys
; long list of fonts from application #2
```

I don't know if GDOS is able to handle something like this, I didn't try.
But as a matural fact, you'll soon won't know what's going on in your
ASSIGN.SYS, you'll have fonts stated more than once, et cetera. You should
merge the font lists for each resolution/output device seperately and
eliminate double fonts at that time.

>What is the most recent version of GDOS (besides the one thats supposedly
>coming out soon) and how can I get it - I have Version 1.1
Oh my God! GDOS 1.1... throw it away and get AMCGDOS 3.21 or AMCLIGHT 4.00
(the latter one is only for registered Gemini users). Or try to get a copy
of the FSM-GDOS from Atari, it looks very fantastic...

I'm currently using the Pure Debugger (including within Pure C, former known as Turbo C). And this debugger is great! It works perfectly on source and assembler level. Both breakpoint and pointer handling have features I really miss when debugging on my Sparc at work. I can't live without breakpoints on changes of variable values, examining large pointer structures (binary trees etc.) just by double-clicking onto the pointers.

The only problem with Pure C is the language: Due to restriction by Borland, Pure C is only available in German. If you can read German, give it a try. If you can't read German, what about learning it? ;-)

I just couldn't believe it. I was reading the sports news paper for
Temple University and on the back page (the whole back page),
Atari had sponsored (i.e. ADVERTISED, SUPPORTED, PAID) for the news paper.

It goes: ATARI
is
proud
to
sponsor
Cherry & White Insight

Who got this past Jack Tramiel? Do they still have a job?
Could Atari make such a horrible mistake and actually advertise?
Did someone kill off the dope at Atari who is against advertising?

Just one of those things that makes you go Hmmm.

Were did you get this info from, I have the latest Neodesk but can't
find how to use any alt, file viewer, I have looked through the Manuals
mant times..Please can you help..

The only way posible to me is as a install application, but this is no
good as there are to many text file extentions..

I can hardly believe it also. I tried for several weeks to get Atari to run
an ad in the Purdue University Exponent(Circ. about 20,000). All they had
to do was e-mail me a Calamus ad and our users group, Purdue Atari Users Group,
would have had it run in the paper. Yes, that's right, WE agreed to pay for
the ad out of OUR treasury and all they had to do was make the ad. Zero cost
to them and total gain for them and it never happened. That shows how much
they really want to advertise.

for gcc we have GDB (2.6 Patchlevel 14.5). Earlier versions of
gdb had mucho problems, but lately we have fixed a lot of them. It is
exteremly usable now. Others and me have been using it on a regular
basis, and it is eminently usabel now. if you get a copy, please make
sure that you get atleast Patchlevel 14.5 (not 14).

cheers

The prices I mentioned are both WITHOUT hard drives. The Mega STe has a
slot for an easy expansion, but it does not come with the HD itself. You
r system might have been sold to you in that configuration, but these
aren't sold like that. What I said is what I would be getting. Nothing
more, nothing less...

PFX Pack (Current English shareware version 1.8e) works with all executables that I have tried it with including: .APP, .PRG, .TOS, .ACC, .TTP and AUTO folder programs. I saved about 50K or more in auto folder programs though it does help if programs are more than about 10K or so, though I have saved as much as 3K on files as small as 7K. Little things can add up. Though it is the large programs where you can really save.

What is the CRAFT Shell?

I haven't seen it here in the United States.

Also, I am under the impression that Lattice C Ver 5.06 doesn't
have a complete UNIX style 'cc' command so you can't use GNU Make
(or any other make) with it.

I own LC5, but my last update was last January to version 5.06.02.

what is your latest version over there?

Also, I just got a copy of the German Turbo C compiler.
seems good but I can't read the german docs , my luck!!

^^^^^

Mark, I hate to burst your buble but that same $2400 that you spent
last year on your STacy will now buy you the new mac PowerBook 100.
And as you well know ANY Mac is better than ANY ST.

so asking megabucks for a used ST 9even a STacy) doesn't compute!!

For the money I would rather buy the new mac Powerbook 100 then an old
unsupported obsolete STacy.

So, you are just getting hit with the penalty of computer obsolence!

4067. HELP WANTED WITH A TRICKY PROBLEM!!!

Newsgroup: comp.sys.atari.st
Date: 1991-11-09 15:11:12 UTC
From: esf041@cck.cov.ac.uk
Message-ID: <99|ASM~@cck.cov.ac.uk>
Source record: 227493

Can any clever atari buff out there help please...
As part of a final year project I am building some hardware to
connect to the ST via the DMA (hard disk) port.

The question is this: how do I control external hardware through
the DMA porrt...?

I know that this involves using the INT, DRQ and DACK pins to poll
external devices, but the software necessary to do this escapes me...

I can toggle the read/write line and am aware of all the hardware registers involved
with the DMA port, and am currently using "The concise atari ST
programmers guide" by K. Peel and find it lacking in detail.

Atari themselves don't want to know. I really need to talk to an ST
buff on this one... :-)

If anyone can help, please EMAIL ONLY to esf041@cov.cck
i.e. esf041%cov.cck@nsfnet-relay.uk.ac

thanks in advance

>
So, what applications are they supposed to run to take advantage of
their speed? Windows? From what I hear, Windows just slows things
down more. Unix maybe? But I'm confused. It's supposed to be all
those great DOS and Windows applications that make 386/486 compatibles
so great, but these are the same applications that make the machines
under rated. What good is the power of a machine if the applications
that make it useful and advantageous to own can't take advantage of
the machine's power.

I don't get it. Sounds like an '030 accelerator for the ST will blow
most any 386 out of the silicon and possibly match or beat any 486
running similar applications. So where's the power?

Well that sound interesting but I don't expect that to work as error-free as
my current setup is doing now. Craft has enough Unixification for now but
when the bash thing has been tested somewhat more it probably will offer
more.

>know if they'll fit into a TT. I probably won't have this access by
>the time I GET a TT. So if these are useful, I'll need to snag them
>now.

To expand memory on the TT one needs to purchase a daughter board
which has a memory controller chip and memory chips on this pc board.
The TT RAM daughter board has either 1M SIMMS for a 4M memory expansion
or 4M SIMMS for a 16M memory expansion. I purchased the TT RAM 4M
expansion (~$500). The ST RAM daughter board can be bought with up to
8M more of DIP memory, I believe. These configurations can be purchased
from Atari. I've heard of other memory expansions which will expand the
TT memory to a maximum of 32M - probably just in Europe. So, if you
add up the total memory expansion available from Atari:

2M of ST RAM on the mother board
8M more of ST RAM on the ST RAM daughter board
16M more of TT RAM on the TT RAM daughter board

26M total

CUL,
Chuck

4075. how fast is an 8 MHz 68000?

Newsgroup: comp.sys.atari.st
Date: 1991-11-09 19:26:55 UTC
From: rreiner@nexus.yorku.ca
Message-ID: <rreiner.689714815@yorku.ca>
Source record: 227553

One final contribution to this debate:

The more or less comprehensive list of Dhrystone results in the official Dhrystone 2.1 distribution contains many data points for 8MHz 68000 systems: Macintoshes (with 5 different compilers), a Motorola PC/68000 coprocessor card, some Heurikons, an Atari Mega 2 (using Aztec C), something from Hogg Labs, etc. All of these numbers are between 500 and 850 dhrystones/sec.

There is one anomaly: a second entry for a Mega 2, this time using Turbo C, which comes in at 1650 dhrystones/sec.

I'm not sure what to make of this, especially when combined with the related claims that have been made here about Turbo C. Can Turbo C for the Atari really generate code twice as good as that of any of the other 15 or so 68000 compilers listed in the results table?

Source record: 227557

Of course, everyone is carefully ignoring the fact that it doesn't matter HOW fast a computer is, if it's unsupported.

Those slow '386 and '486 machines belong to a viable marketplace where the software base is growing and improving. Windows may be slow today, but at least there's a chance it'll be improved tomorrow. You can't say that about very many ST programs.

It's a little like owning a 426 Hemi Barracuda and sneering at all the "performance cars" of today... except that you can't find Premium Leaded gas to drive it anymore.

4079. Wanted * Power Supply *

Newsgroup: comp.sys.atari.st
Date: 1991-11-09 21:46:21 UTC
From: Jon_Clarke@kcbbs.gen.nz
Message-ID: <78381.312917016@kcbbs.gen.nz>
Source record: 227484

Urgently required ... a 250volt 50hz Atari Power Supply

We urgently require a PSU for the Atari SH series of Hard disks. It
is the same that is in most machines (bar the mounting plate which we
do not need) ie the 520stfm,1040stfm,1040ste,tt etc ....

If some kind soul can emeil me an address of where I can order one or
if you have a spare please EMail me at Jon_Clarke@kcbbs.gen.nz .
If you do have a spare one please email me the prioce and I will send
a Telegraphic Transfer (TT) to your bank account for Urgent Delivery.

Thanks in advance..

In <1991Nov7.194716.587@mailer.cc.fsu.edu> boyd@pipe.cs.fsu.edu (Mickey Boyd) writes:
>[less]
> The only thing I miss is the ability to hit "v"
>and fire up an editor (less reports "no shell!"), but I can live with that.

hmm, did you set $SHELL and $EDITOR ? the shell has to understand
'-c <command>' and the editor shouldn't use GEM, though.

>It is so nice to have a file viewer I can search for stuff with (using the
>"/" directive)!

true. or under MiNT, you can put it at the end of a pipe and then
search and scroll around in the output...

>By the way, this is the less available from atari.archive in the file
>/atari/utilities/less.arc. There is also a less97.arc out there, but it
>is a MINT specific port.

well, actually that version _did_ run under TOS (to a certain
extent at least), only it needs something sensible in /etc/termcap.
the reason i hacked on it was another: to fix a bug that sometimes
caused it to allocate much more memory than it really needed...
diffs are short enough i think i can simply post 'em here. :-)
(the other changes are to keep poor ol' GEMDOS a little more happy
when running under TOS, and because of differences in the MiNT
library the original port used. lib/console.c is from MiNT lib
pl 10, but looks like pl 14 needs the patch as well. (guess my
`bugreport' was a few days late :-))

btw, eric, did you get my last 2 mails? looks like some box on the
(UUCP) way to my home address is dropping mail. :-(i've set
Reply-To to send a copy to my bitnet address, in case you read this...

ah yes, and while i'm at it: job control in MiNT 09 works better
now, but stopping eg a less that was spawned from another program
(eg another less, like when u hit `h'elp :-) still requires more
than one ^Z, if it doesn't hang MiNT completely. (similar to
the `hanging bash syndrome'... :-( ) maybe it's a difference when
a program does `kill(getpid(), SIGTSTP);' instead of getting the
signal from the terminal directly?

>...
>Also, I have a buddy that complains about not having a good pager program for
>his TT. We are going to test out less to see if it works on his system.

maybe you'll have to adjust :li and :co in in the termcap entry,
but otherwise should be no problem.

```
bye...

From: n160ao@tamuts.tamu.edu
Message-ID: <5762@tamsun.TAMU.EDU>
Source record: 227559

Here is the TeX setup document that I have been promising. I would have sent it to the 50+ addresses individually, but I think that would have taken me another day (given my time-schedule). So here is the first draft. Those people requesting a first draft, please read this and give me your positive/negative input.

Others, please press "n" to breeze past this 12 page document.

Atari ST TeX experiences from the USENET

TeX (pronounced "teck", where the "X" is the greek character chi) is a book and document formatting system that gives the user the absolute best text formatting possible.

Normally TeX is found on mainframe or mini-computers in corporations and educational organizations. These versions of TeX are usually quite large and robust. The printing looks great, but you have to leave home and visit your local computer center to view a good copy of a TeX'ed document.

Fortunately, for those users that enjoy working on a personal computers, TeX is available on virtually every popular micro-computer available in the 1990's. According to Bart Childs, former president of the worldwide TeX Users' Group (TUG), the Commodore Amiga and the Atari ST have some of the best versions of TeX available for any computer. This article is designed to give you a current set of instructions and

comments regarding the most popular versions of TeX for the Atari ST.

The two popular flavors of TeX (as of November 1991) are:

- regular TeX (the one that must be pieced together by
the ST user)

- CS-TeX (a set of diskettes containing a complete TeX document
creation environment which fully installs
itself. Written by German Atari wizard
Christoff Strunk.)

Each version has some advantages, but neither provide all of the
advantages.

Regular TeX has the advantage of running well on computers
with a small amount of memory (1 Megabyte). It interfaces well with
several tools for printing and viewing TeX files. Its disadvantage is

that it requires a lengthy manual installation. A manual installation
will make the installer an expert on TeX installations, though.

CS-TeX provides a full environment for creating a TeX document from
start to finish. CS-TeX provides:

- an editor,
- TeX,
- TeX format builder,
- two TeX file screen pre-viewers,
- Metafont,
- an Index builder,
- a bibliography tool,
- graphic file interfaces
- and a simple graphical user interface

The graphical user interface is optimized for people who don't like to
use a mouse, and the graphic file interfaces allow Pictures and graphs
created by other programs to be used in TeX documents.

Configuring the Plain ST TeX software for the first time

Configuring the ST TeX software actually involves several
ordered steps.

1) Obtaining the TeX software

2) Creating a customized directory system

3) Un-archiving the TeX software

4) Setting up environment variables

5) Creating the TeX "format" files.

STEP DETAILS
============

>> 1. Obtaining the TeX software

This step has a fairly broad scope, but one source for the
Plain TeX system is the Atari Archive ftp site at the
University of Michigan in the United States. Its ftp
name and internet number are:

atari.archive.umich.edu 141.211.164.8

For the configuration instruction discussed in this document,
you should obtain the following files:

So, This is Your First Time to Install TeX on Your Atari ST! Page 3

Directory: /atari/tex/tex31

size date name
======= ============ ============
376570 Dec 31 1990 inputs.lzh
26451 Aug 14 18:57 poofiles.zoo
520881 Aug 14 18:50 texbin.zoo
342243 Dec 14 1990 tfmfonts.lzh

Directory: /atari/tex/dvi

size date name
======= ============ ============
58562 May 18 1990 dviatari.zoo (S)
239494 Apr 12 1989 dvieps.arc (P)
151658 Aug 6 12:07 shdvi10b.zoo (S,P)

Directory: /atari/tex/fonts

size date name
======= ============ ============
365612 Sep 6 1989 dvifnts1.zoo
471608 Sep 6 1989 dvifnts2.zoo
1910 Sep 6 1989 dvifntsz.hlp
208619 Sep 22 1989 showdvifonts.zoo

Most of these files are required, but some of them provide
duplicate function. The files in the "/atari/tex/dvi"
directory provide printing and pre-viewing functions. If
you have the space, get them all.

- The "dviatari.zoo" archive contains "dviatari", a screen
pre-viewer that uses the "dvifnts*.*" archives in the
"/atari/tex/fonts" directory.

- The "dvieps.arc" archive contains "dvieps" a program and
source code to print TeX's dvi-files to a 9-pin EPSON
compatible printer. "dvieps" also uses the "dvifnt*.*"
archives' font files.

- The "shdvi10b.zoo" file contains "showdvi", a pre-viewer,
and "dviprint", a dvi-file printing program. "dviprint"
will output to several types of printers including:
Epson 9-pin, Epson 24-pin, Atari SLM, and HP Laser-Jet
printers. Both programs can use the "dvifnts*.*" font
files. In addition, the programs can use "flib", font
library, files, that are in the "showdvifonts.zoo" archive.

You need at least one (S) "Screen pre-viewer" and one (S) "Dvi
file printer" archive. For either of the sets of pre-view and
print programs, you will need the "dvifnt*.*" files. If you
want to use the "flib" font library ability of the "shdvi10b.zoo"
programs, then you should get the "showdvifonts.zoo" file also.

So, This is Your First Time to Install TeX on Your Atari ST! Page 4

>> 2. Creating a customized directory system

This part requires you to think the hardest. The following
directory names are a compromise of the directory names
used by usenet users who contributed to this article.

i. Select a base directory for your files. I will use
"D:\tex" for the base directory. Edit this file (the
one that your are currently reading) with a text editor
and use the global search and replace function to change
"D:\tex" to the directory you want to use.

ii. Create a fonts directory directory:

D:\tex\fonts

This is the directory where you will place your
TeX Font Metric (tfm) fonts and possibly the device
fonts for the pre-viewer and your printer.

iii. Create a binary, or executables, directory:

D:\tex\bin

This is the directory where you will place your
".ttp", ".prg", ".tos", and ".app" files.

iv. Create an inputs directory:

D:\tex\inputs

This is the directory where you will place all of
files that TeX needs for initialization.

v. Create a format directory:

D:\tex\formats

This is the directory where you will place the files
containing a memory map of initialize TeX variables
called "format files." These format files are discussed

in sub-section ">> 5."

vi. (Optional) If you are going to use font libraries, then
you will want to make the following directory:

D:\tex\fonts\flibs

This is the directory where you will place the files
containing "pk" fonts squished into one file that
has a name in the form of "pkxxxx", where "xxxx" is
replace by a number between 0000 and 9999. The number
represents the resolution in dots-per-inch of fonts in
the font library.

So, This is Your First Time to Install TeX on Your Atari ST! Page 5

>> 3. Un-archiving the TeX software

You may have noticed that the files from the Atari Archive are
all in a ".arc", ".lzh", or ".zoo" format. Each of these must
be de-archived with their respective archive utility.

To get the appropriate archive utilities, use ftp to get an
"arc", "lzh", and "zoo" archive utility from the "/atari/archivers"
directory in the Atari Archive.

Using either a shell facility or the desktop change to the following
directories and issue the commands following them:

```
cd d:\tex\bin
zoo -restore texbin.zoo
zoo -restore poofiles.zoo
arc x dvieps.arc (*)
zoo -restore dviatari.zoo (*)
zoo -restore shdvi10b.zoo (*)
```

(*) NOTE: You only need the files that you down-loaded, as
mentioned earlier in section ">> 2."

```
cd d:\tex\fonts
zoo -restore dvifnts1.zoo
zoo -restore dvifnts2.zoo
lzh -restore tfmfonts.lzh (**)
```

(**) NOTE: You may need to use "x" instead of "-restore"
depending on your lzh utility)

if you are going to use the "flib" font library
capabilities of the "shdvi10b.zoo" archive's "showdvi" and
"dviprint" programs, then you will also need to run

```
zoo -restore showdvifonts.zoo
```

NOTE: The "showdvifonts.zoo" filename is too long for TOS.
You were required to give it a valid TOS filename

before you could down-load the file to your computer.
Use that name here.

```
cd d:\tex\inputs
lzh -restore inputs.lzh
```

>> 4. Setting up environment variables

The TeX program, the screen pre-viewers, and the dvi-file
printer programs all use environment variables to locate
necessary files.

So, This is Your First Time to Install TeX on Your Atari ST! Page 6

At the time of writing, I had only used TeX with "gulam" and
"NeoDesk". Several environment variable programs are available
for the ST. Follow the documentation with the programs, setting
the environment variables to the same values listed below.

```
TEXFONTS = D:\tex\fonts
TEXINPUTS = .;D:\tex\inputs
TEXPOOL = D:\tex\bin

PKDIR = D:\tex\fonts
FLIBDIR = D:\tex\fonts
DVICONFIG = D:\tex\config
```

Explanation:

TEXFONTS tells TeX where the TeX Font Metric (tfm) fonts
exist. The tfm fonts are special fonts that TeX uses
when creating a dvi-file.

TEXINPUTS tells TeX where to look for input files. The
"." is included to make TeX look at the current
directory that you are using.

TEXPOOL tells TeX where the binary and the pool (.poo) files
exist.

The last three variables are for the "shdvi10b.zoo"
programs, "showdvi" and "dviprint". If you are not going
to use these programs, then simply leave these variables out.

PKDIR tells the "shdvi10b.zoo" programs where to find the
individual "pk" font files.

FLIBDIR tells the "shdvi10b.zoo" programs where to find the
files containing the "flib" font libraries.

DVICONFIG tells the "shdvi10b.zoo" programs where to find their
configuration files.

NOTE: In the "gulam" shell, set the variables using the
following form.

setenv VARIABLENAME 'data'

for example,

TEXINPUTS = .;D:\tex\inputs

would be

setenv TEXINPUTS = '.;D:\tex\inputs'

So, This is Your First Time to Install TeX on Your Atari ST! Page 7

>> 5. Creating the TeX "format" files.

At this point TeX is practically running, and you could even start
using TeX at this point if you used very low level TeX commands.
These low level commands are to TeX as assembly language is to
a high-level language compiler. Attempting to use TeX at this
point would probably yield an error stating something like:

Can't find `PLAIN' format file.
You must generate this one first.

OR

Format file error. Aborting

Because you are using high level commands when TeX needs
low level commands. To correct the problem, simply create the
format file using a feature of TeX 3.x to build the files. The
format file contains high-level TeX commands composed of the
low-level TeX commands. The following steps describe building
the main format file.

i. At the shell prompt or desktop execute TeX with the
following command and parameters:

tex plain -i

ii. When TeX has finished creating the format file, it will
stop. You must then type:

\dump

to make it create the "plain.fmt" file and exit TeX.

iii. Last, you need move the file to the "D:\tex\formats"
directory, using your favorite file utility program.

To build format file for LaTeX, replace step "i." with

tex &lplain -i

And follow steps "ii." and "iii." the same way as you did for
the TeX "plain" format file.

The font conventions
====================

TeX for the Atari uses four types of fonts:

"tfm" which are TeX Font Metrics
"pk" which are Device output fonts
"gf" which are Metafont output files
"mf" which are Metafont font programs

So, This is Your First Time to Install TeX on Your Atari ST! Page 8

The tools configured in the last section only use the "tfm" and the "pk" fonts. The "gf" and the "mf" files will only be needed if you desire to create fonts for which you don't already have "tfm" and "pk" fonts. If you do create fonts, you will also need a tool called "gftopk" which converts the "gf" Metafont output files to "pk" font files.

Each font has a name that usually includes a point size. For example, "cmr10" means it is the 10 point size of the Computer Modern Roman font. That font can be scaled though. TeX has the ability to use magnifications of fonts rather than forcing a use to create larger and larger point sizes for the fonts.

A magnification is in terms of 1000's. A magnification of 1000 means that a font is the size for which it was designed. A magnification of 1200 means that a font is 1.2 times the size for which it was designed. A magnification of 850 mean that a font is 0.85 times the size for which it was designed.

Programs that use "pk" files name their font files in terms of dots-per-inch (dpi) resolution. So the "cmr10" font for a laser printer would be include "300" in the name, because laser printers are 300 dpi devices.

Since printing devices print at fixed resolutions, so printing a 150 dpi font on a 300 dpi printer would result in a font looking half the size it should be. In fact, a 150 dpi font on a 300 dpi printer would be a font at a magnification of 0.50. A cmr10 font at a magnification of 1200 on a 300 dpi printer would include "360" (300 x 1.2 = 360) in its name.

Because placing both the font name and the dpi size in the same filename limits the names of the fonts, two font naming conventions have evolved. The "dvieps" and "dviatari" programs use the first convention and the "showdvi" and "dviprint" programs use the second convention. These two conventions group font files into directories. The directory contains either the font name or the dpi size, and the file inside the directory contains the part of the full name that was not use in the directory name. Both contain the same information, but each have a different style of directories and files. For example, given two font styles with three magnifications for a 300 dpi printer:

cmr10 cmrsl10
250 dpi 250 dpi
300 dpi 300 dpi

360 dpi 360 dpi

The first convention would store the fonts in the following format:

D:\tex\fonts\cmr10\250pk
D:\tex\fonts\cmr10\300pk
D:\tex\fonts\cmr10\360pk

D:\tex\fonts\cmrsl10\250pk
D:\tex\fonts\cmrsl10\300pk
D:\tex\fonts\cmrsl10\360pk

So, This is Your First Time to Install TeX on Your Atari ST! Page 9

The second convention would store the fonts in the following format:

D:\tex\fonts\250pk\cmr10
D:\tex\fonts\250pk\cmrsl10

D:\tex\fonts\300pk\cmr10
D:\tex\fonts\300pk\cmrsl10

D:\tex\fonts\360pk\cmr10
D:\tex\fonts\360pk\cmrsl10

The second convention uses fewer directories when you have many fonts, which a normal TeX system will usually have. The first convention uses more directories but must be used for the "dvieps" and "dviatari" programs, which use the "dvist" font naming convention. The "dvist"-type programs look at the TEXFONTS variable to see where the font directories exist. So if you want to use the "dvist" type programs, you must actually have your ".tfm" fonts mixed in with "pk" font directories. A mixture of fonts in the same directory makes things confusing and is not a recommended way of configuring the fonts.

The "shdvi10b.zoo" programs, "showdvi" and "dviprint", can use the first method of naming fonts if a simple configuration file is modified. But, unless you are going to use both the "dvist" type programs and the "shdvi10b.zoo" programs together, I recommend using the second method. (You may spend some time copying the font files from the first convention, as distributed in the "dvifnt*.*" files, to the second convention.)

Other advantages to using the second method are:

- At a glance you can verify which fonts are available at a certain magnification

- You don't have to make your "FOLDRxxx.PRG" so large to avoid the "40 Folder limit" bug in TOS

- The FLIB libraries use the same type of convention

An alternate font directory structure to the one mentioned in the
second section of this document follows:

```
d:\tex\fonts\tfmfonts
d:\tex\fonts\screen
d:\tex\fonts\screen\font0096\cmr10.pk
d:\tex\fonts\printer
d:\tex\fonts\printer\font0300\cmr10.pk
d:\tex\fonts\flibs\pk0300
d:\tex\fonts\flibs\pk0250
```

an so on.

So, This is Your First Time to Install TeX on Your Atari ST! Page 10

Using "dvieps" for EPSON 9-pin output
=====================================

"dvieps" has several options. I will not cover any of them,
because the documentation supplied with "dvieps" covers all the options.
Using the first font directory/file convention from the previous
section, you should be ready to use "dvieps". Simply type:

```
dvieps filename.dvi {where filename is replace by
the name of the dvi-file you
are attempting to print}
```

and "dvieps" will create a file with a ".eps" extension containing the
appropriate EPSON 9-pin codes to make a TeX printout. Now simply use
your favorite file printing program to print the new file out. Make
sure the file printing program does not alter the file that it prints.
Gulam and some other shells attempt to beautify printed files, which
makes plain text look good, but makes dvi-files unprintable.

Using "dviatari" for screen output
==================================

"dviatari" uses the same setup and configuration that "dvieps" uses.
To view a file simply type:

```
dviatari filename.dvi {where filename is replace by
the name of the dvi-file you
are attempting to print}
```

and "dviatari" will display a few messages and then display the TeX file
in a fairly readable form.

Using "showdvi" for screen output
=================================

Both "showdvi" and "dviprint" use similar configuration files that
I will discuss in this section. Both of these configuration files should
be placed in the directory indicated by the DVICONFIG environment
variable. I suggest that you use a directory named "D:\tex\config."
The "showdvi" font configuration file is called "showdvi.fnt." An example

"showdvi.fnt" follows:

```
pk_str %s\%dpk
font D:\tex\fonts

flib_str pk%04d
flib D:\tex\fonts\flibs
```

The "%s\%dpk" in the "pk_str" line means to convert the font "cmr10" at a resolution of 300dpi to "cmr10\300pk". The next line means that all converted font names have a "D:\tex\fonts" added as a prefix; making the example: "D:\tex\fonts\cmr10\300pk".

So, This is Your First Time to Install TeX on Your Atari ST! Page 11

The "pk%04d" in the "flib_str" line means to convert the font "cmr10" at a resolution of 300dpi to "pk0300". The next line means that all converted font names have a "D:\tex\fonts\flibs" added as a prefix. This means that "dviprint" and "showdvi" will look into the "D:\tex\fonts\flibs\pk0300" flib library file for the "cmr10" font.

For an additional example, lets make another configuration file for the alternate directory structure.

```
pk_str font%04d\%s
font d:\tex\fonts\screen

flib_str pk%04d
flib d:\tex\fonts\flibs
```

Now to use "showdvi" simply type:

```
showdvi filename.dvi {where filename is replace by
the name of the dvi-file you
are attempting to print}
```

and "showdvi" will display the TeX file on the screen.

Using "dviprint" for EPSON 9-pin or 24 pin printers
==========

Create or modify the "dviprint.fnt" file located in the directory indicated by the DVICONFIG environment variable that you set earlier. Make the file nearly identical, but alter:

```
pk_str font%04d\%s
font d:\tex\fonts\screen
```

TO

```
pk_str font%04d\%s
font d:\tex\fonts\printer
```

when using the alternate directory convention that I mentioned.

Now, to print a dvi-file directly to a 9-PIN printer, type:

dviprint -d 4 filename.dvi {where filename is replace by
the name of the dvi-file you
are attempting to print}

and, to print a dvi-file directly to a 24-PIN printer, type:

dviprint -d 1 filename.dvi {where filename is replace by
the name of the dvi-file you
are attempting to print}

So, This is Your First Time to Install TeX on Your Atari ST! Page 12

Simply typing "dviprint" alone will display all of the options that it offers. These options are also included in the brief documentation provided with the program.

Finding 24-pin fonts
====================

I found 24-pin fonts in the "/atari/fonts" directory of the Atari archive, I found a "N24PIN1.LZH" and "N24PIN2.LZH" files which contained all of the fonts I needed in a series of sub-directories named "mag____1.000" and "mag____1.200" and so on. I simply renamed these directories to "D:\tex\fonts\printer\font0360" and "D:\tex\fonts\print\font0432" respectively, and so on. "dviprint" worked great after that.

CS-TeX
======

There is little to say about CS-TeX. Look in the "/atari/tex/cs-tex" directory in the Atari Archive and down-load the eight files. Un-archive each file to a disk. Then printout the readme file. It is an english file that tells the user how to install CS-TeX. Last, simply click on the "INSTALL.PRG" program, and CS-TeX does everything that I have described in this document and more.

Extra-Help and Disclaimer
=========================

I want comments to this file. I like compliments, but I think constructive criticisms and suggestions would be most valuable to other Atari TeX users. Send all comments to the following usnet mail address:

tamuts.tamu.edu!n160ao (Mark Lehmann)

This information is simply advice for configuring TeX on the Atari ST computer. I don't guarantee that it will work perfectly; (but I made it work on my machine) and I am not going to be liable for any harm this document does to you. Some examples of harm are:

- making a bad grade on a semester project because you couldn't make TeX work on your computer

- losing your job because you couldn't make TeX work on your computer

- medical care for broken fingers or hands from hitting hard objects
in frustration.

>

Is there any way this chip could be "upgraded" to handle high density
disk drives?

I've seen high density mods for the ST, but there was always a catch...

> for the Atari really generate code twice as good as that of any of the
> other 15 or so 68000 compilers listed in the results table?

Turbo C probably does a respectable job of optimizing, but the
biggest difference stems from the method that the Turbo C compiler
uses to pass arguments to functions. Most C compilers push arguments
onto the stack. Turbo/Pure C passes arguments in registers, where
possible. Register references are much faster than references to
stack memory. Thus Turbo C's function calls execute faster.

Only 15% of dhrystone's statements involve function calls, according
to the documentation, but function calls are far more ``expensive''
in terms of machine time than the other components (assignments and
control statements). Anything that speeds up function calls will have
a marked effect on the number of dhrystone loops per second.

True, but the TOS port of less stems from a vastly hacked version of that source (actually a much older version). I would rather not duplicate this effort, although it looks like I might have to. I think I will start out with the MINT port (given that the TOS source does not show up).

On page 69 of my Neodesk 3 manual. Drop down menu "options", menu entry "Set Preferences", button "paths", text entry dialog "alternate text file viewer reader". This is for Neodesk 3.01 and above. I don't remember if this was an option in previous versions.

You can pass Malloc a -1 value, and the value it returns to you will be
the ammount of free memory left that you can allocate. Normally that
value would be the address of the memory that has been allocated, but it
is changed in this special case.

I hope this helps you out.

4088. SST, MegaTalk, Gadgets Updates

Newsgroup: comp.sys.atari.st
Date: 1991-11-10 09:37:02 UTC
From: dsmall@well.sf.ca.us
Message-ID: <28374@well.sf.ca.us>
Source record: 227579

It's been awhile since I've been able to slack off from fulltime SST work and get to the Net (*alas!*). The recent HackerCon reminded me ..

First, the direct link to Gadgets has died. For reasons only they know, our path (boulder.edu!tcr!gadgets) has been shut down at boulder. I have no interest in playing politics in Boulder, which is like bringing wheat to Nebraska.

However this message reached you is thus the only known path to Gadgets. I will probably get a UUNET path, since they've got a "getaway special" that is hard to resist.

Second, time to stamp out a rumour. We get ~ 5-10 inquiries per DAY regarding Spectre 3.1, particularly in Germany ... where can they get it, they have heard it is available. To be blunt:

Spectre 3.1 DOES NOT EXIST YET.

Yes, we are working on it, but it is not close to release, and has not even reached Beta Test.

Spectre 3.1 does this:

a) Fixes (minor) bug on cached accelerators on machines with less than 4 megs of RAM, where the cache fools Spectre into thinking there are 4 megs. Nice going, cache designers. What does "No RAM there" imply?

b) TT SCSI support. There seems to be some illusion that this is a bug in 3.0. In truth, we had 3.0 solid, "golden version", then the TT shows up. We could either support it a LITTLE BIT, whatever we could do fast, or forget it totally. TT SCSI is "real fun" <-- sarcasm and, for example, Atari USA can
not even be bothered to give us some sample r/w sector code to save us time. Also, there's the braindread XGEM scheme to worry about, as opposed to the free-world Supra/ICD/BMD/etc partition scheme.

c) System 7.0 will accidentally work on Spectre 3.1, emulating reality. I have no idea on 7.0.1 or whatever they are going to do. Someone at Apple needs a class in checking for error (Nil) returns from memory (Malloc equiv) calls.

Spectre 3.1 WILL NOT DO APPLETALK, WILL NOT CURE ACNE, AND WILL NOT SOLVE SOFTWARE PATENTS.

There is a chance, depending on the resident evil in the MMU, that 3.1 on a 68030 machine will allow Spectre to run in SST ...err, faster RAM.

No decision has been made on that. We'll have Dan Moore flip a coin.

Spectre 4.0 is in the gears.

If someone cares to send me TT code that will reliably read/write
the SCSI drives, they will probably get considerably more than chocolate
chip cookies in their stockings this holiday season. With the SST and
MegaTalk,
I do not have much time for experimenting.

Third: MegaTalk.

Friday, November 8, Sandy, Jamie (age 3) and I picked up the first
production run of MegaTalk boards. Looking good. We are busy with the
details of combining them with a virus-free disk and manual and
stuffing them into a box so attractive you can't resist.

I hate to say it, but as usual, we're back ordered.

Hence if you have a MegaTalk order in, have hope.

Fourth: SST

The SST has been undergoing minor tuning, getting faster chips,
that sort of thing. To the best of our knowledge, it is now dead solid
to 40 Mhz, and if you want to shell out $3.50 (dollars) for a faster
oscillator, that's up to you. I have run an SST for 12 days at 40 Mhz
doing "Boink", which is a good exerciser, out of burst mode 32-bitRAM
until the ST nearly shrieked of boredom. Looking good, folks.

It is my personal commitment to start shipping SST's this week
(in USA, that is Tuesday November 12, since Monday is a national holiday).
We had a chip supplier give us some jellybean chips that were from a bad
die, but that's not the end of the world; there are other suppliers that
aren't lobotomized.

Fifth: Spectre GCR for the TT & SST

Some Spectre GCR's work wonderfully with TT's, like the ones we
showed at CeBIT,in our lab, et al. Some apparently do not. Some empirically
minded people found that yanking the TT RAM boards "made it better".

There are a couple of bogus fixes for this that we have heard of.
The problem is a race condition against address-rot (where the address
lines fade from good values), as I understand it.

The first is something about piggybacking a 7407 (?) on top of
the one in the TT. I personally can't see why waving a dead chicken inside
of a pentagon with black candles would make a difference, either, but maybe
someone knows something I don't, particularly people that didn't design
GCR. If someone has some valid reason that this should make a difference,
drop me a line.

The second, believe it or not, is to replace about every frickin'
chip in the GCR with AS or F or S equivalents. Hey, that's great. You've
got a bunch of TT's, all with different address rot timing, so we'll just

speed up instead of fixing the REAL problem.

The fix we KNOW works is to add a simple inverter piggybacked to
another chip, clipping off all but 4 pins (power,ground, 2 active pins),
and golly actually running 2 wires. The inverter changes where we strobe
data in from the address bus, and works a heck of a lot better than
waving the dead chicken. (And if you get the chicken near the candles,
it smells like, well, fried chicken... more like burnt.)

We GIVE THIS FIX INFORMATION AWAY. If you know what end of a
soldering iron to hold you can prolly manage it. This is not heavy stuff.

Again,if you have a working GCR on TT, Don't Fix What Works.

We believe the reason the TT RAM board yanking worked is that with
the TT RAM board in there, address rot happened faster, and the GCR latched
data as bogus as <fill in witty entry, I'm fresh out>.

In order to get the TT-GCR Fix data, IF YOU NEED IT, FAX
USA (303) 791-0253, and please don't expect the return fax within
microseconds.
Things is awfully busy,or I woukldn't be up at 3:30 AM.

I would post the actual chip numbers et al but Sandy doesn't want me
to, and that's reason enough. Ever argue with a mad wife?

Sixth:

Our wonderful Barbara, who was with us from the launch of Gadgets,
has gone to her life's dream of living in Jamaica. Those of you who have
talked
to her know. Please don't bother addressing things to Barb.
"Dave", "David", "Hey, You", "Geeker Geek" -- they
will all work.

We will all miss Barb a very great deal!

So, things are going well, the things izz actually getting out
the door, and software is progressing along.

If you could, spread the word that 3.1 doesn't exist (yet).
We're awfully tired of being told it does, and getting the Evil Conspiracy
Treatment For Not Giving It To Them Right There.

And that's not even the dumbest rumour floating around.

Thank you. We return you to your regularly scheduled signal to noise.

David Small

4089. Software availability in Germany

Newsgroup: comp.sys.atari.st
Date: 1991-11-10 17:14:47 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991Nov10.171447.9850@noose.ecn.purdue.edu>
Source record: 227567

Hello,

It's common knowledge that Atari sells a lot more STs in Germany than
here in the US. I would expect that because of this that there would
be a much bigger software base there. Yet apart from a few applications,
not much software is available here apart from applications developed
here in the US. Could any of you guys over there post a brief listing
of the state of the art software in each of the following categories:
1. DTP, 2. Mathematics software (anything like Mathcad for windows,
now that FSM GDOS is available) 3. CAD 4. C compilers (I'm aware
of Pure C) 5. Anything else that you can thing of that is bemerkungswert
that I didn't list here.

German docs aren't a problem for me because I can read German, but
I suppose most people here can't, so it would be good if you
could say if German or English docs are available. Also, the address
of a distributor would be handy, if that's not too much too ask.

On behalf of this side of the Atlantic, I thank you in advance!

Jim

Note that this returns the size of the largest block, so if your
memory is fragmented, it will return less than what you'd expect.

Ok, my friend Alex has Laser C which comes with a fantastic
source-assembly level debugger, it's called ldb I think....personally
I don't like the compiler itself but it is worth it to buy the whole
package JUST for the debugger

I hear that Turbo C version 2.00 comes with an excellent source level
debugger, but that's all I know (ahh..the docs are in german I think).

4092. For Sale

Newsgroup: comp.sys.atari.st
Date: 1991-11-10 17:58:52 UTC
From: niko@SERVER.CS.JHU.EDU
Message-ID: <9111101758.AA02084@ucbvax.Berkeley.EDU>
Source record: 227569

For Sale:

- MultiGEM. A good package but needs a hard disk or two disk drives
to work well. I only have a single drive system. Three weeks old.
Good for ST,STe,TT. Asking $40 +sh.

- Replay VII (8) Sound digitizer+Editor and Drumbeat software.
A couple of months old. Works fine. Asking $40+sh

Both items are in good condition, come with original manuals,disks,boxes.

In article <jensen.689545293@schulz> jensen@nosc.mil (Layne Jensen) writes:
>I recently acquired a copy of Mark Williams C version 3.06. I have scoured
>the manual to find out how to include in-line assembly code in the C source
>program, but cannot find any references to it.
>
>Am I somehow missing the part of the manual that discusses it, or does the
>compiler not support in-line assembler? If you know how to do it or know
>that it isn't possible, I would appreciate hearing either way. Apologies
>if I have somehow missed the obvious.
>

There is no need for in-line assembly with MWC because you can have your
assembly code in a different file and just compile it together with the
rest of your C code files...however, you should use MW specific assembly
languange, as it is described in the manual (under topic: as)...it is
quite similar to 68000 asssembly...(i also think that MWC provides a flag
-VM6800 or something like that...for using 68000 assembly)

Hope I helped..

4094. WordPerfect 2.x for the Mac (via Spectre)

Newsgroup: comp.sys.atari.st
Date: 1991-11-10 18:14:31 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Nov10.181431.13190@rodan.acs.syr.edu>
Source record: 227572

When WordPerfect 2.0.1 came out for the Mac, I posted to the net about how slow the program was on Spectre and about how the date/time stamp would crash Spectre. Well, there are now newer versions around, i.e. 2.0.2 and 2.0.3. Both of these are much faster than 2.0.1, making it almost nice to use WordPerfect. Also, the newer versions don't seem to crash when I insert the time/date stamp (actually, I'm not sure about 2.0.2, since I replaced it with 2.0.3 rather quickly). Anyway, I just thought some of you out there might be interested in the program, now that the performance is a bit better (educational price is below $150, I believe).

Have you actually tried the MiNT version of less under TOS? I can't imagine anything particularly MiNT specific that less would have to do, so it probably works. (Programs compiled with the MiNT library will run under TOS unless they use some MiNT specific features, e.g. they try to fork() or use pipes).

For example, the BSD "more" that I compiled with the MiNT library works fine under both TOS and MiNT.

From: PHR00JG@TECHNION.BITNET
Message-ID: <91314.172900PHR00JG@TECHNION.BITNET>
Source record: 227574

As a TeX "veteran" (using it on various platforms since 1982), could I suggest that version numbering respects or at least reminds the OFFICIAL TeX version used? CS_TeX 2.10 is awfully confusing in 1991 where TeX 3.1x is probably the current version number. If CS_TeX 2.10 had anything to do with TeX 2.xx, I would not touch it because of lack of compatibility with the rest of the world. I know it hasn't, but why confuse a situation which is already not very simple because of the sophistication of TeX?

It had been announced in this net a few months ago.
Potential user, better check your new software on thorough test cases.
Also, having taken a class in numerical analysis before wasn't lost time,
on the contrary.
Indeed, I quickly have given up an attempt to port some (large) program
with it, after a few first surprises with some calculations.

If your job with this compiler fails, there is another feat which might
help: the f2c Fortran-to-C converter found with ftp to netlib@research.att.com

Jacques

Hey! There is already a FORTRAN compiler at atari.archive (terminator).

In the atari/languages directory it is the file bcf.lzh. It is a
German product, but there is an English TeX document in it that
translates all of the German error and status messages.

I would have posted this earlier if I had known that no one else would
respond.

4100. Video Toaster

Newsgroup: comp.sys.atari.st
Date: 1991-11-10 20:19:29 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <sd7NFFm00VB007DIB1@andrew.cmu.edu>
Source record: 227577

First, let me preface this by saying that I actually like the Amiga, it is just some of it's more pious followers that I can not stand.

OK. All those holier than thou, stick up the butt, my machine is better than your machine, poop heads who have been touting the Video Toaster from Newtek to be the final argument as to why the Amiga was, and would always be, a better machine than any other, and that such hardware would never be available to the lowly users of other machines, can now shoot themselves. Preferrably in the head, but the foot would do nicely, thanks.
It is now official. Newtek has announced realease of the PC MS-DOS version of the Video Toaster, for IBM PC's and compatibles. Can an ST version be all that far behind? Or a mac version, for that matter? Once that arrives, along with the Lexicor software, and a 24 bit board, it would make one damn cheap video system, even cheaper than the Amiga. And when MTOS comes out, the last claim to fame of the AMI-OS, assuming that MTOS is what it is claimed to be, will be gone as well. All this relies a bit oin speculation about the Atari side, but even still, it is nice sometimes to burst the bubble of the overly pious by reminding them that the rest of the world moves on.
Here's to Newtek, and to forward thinking.

mark

All hail the guru, and the interlace video headache.

Adspeed ST and Adspeed STE from ICD (known for their SCSI-Interfaces)
is a 16-MHz Tune-Up kit for the Atari ST/STE. Itm ainly consists of
a 16-MHZ CPU, which is soldered onto the back of the old CPU, which
is not used anymore. For games etc. you can switch back to 8 MHz.
Price in Germany is around 400 DM. That makes something like 250 US $.

Umm. I believe the PC version is the same as the current Mac version...
it's a stock Toaster card in a relabeled (NewTek) Amiga 2000 computer.
The PC/Mac connects via a serial port (or similar) for remote control.

There's no doubt that a PC/Mac Toaster-like-effects card can be done
(and I'm sure some are coming), but the NewTek Toaster itself is still
based around an Amiga at this time.

>
>The info I need is: what is a SCSI terminator? Is it a jumper? What
>will happen if I try to use the drive without one?

The full name is "terminating resistor pack". All the ones I have seen look like:

```
+------------------+
| |
+-+-+-+-+-+-+-+-+-+
| | | | | | | | | |
```

That is, a little flat rectangular component about 1" long, with either one or two rows of vertical pins on the bottom. The component usually mates to a set of one or two in-line little pinholes. The component is removable. I have had two terminated drives work on my system, but I have never tried a single non-terminated one.

The idea here is to have the last drive on the cable (not necesarily the last SCSI id'ed drive) terminated, with all others non-terminated. In addition to the terminator, there are also usually jumpers that select the SCSI ID, and perhaps select a few drive options, like parity. If you have only one drive, it should be terminated.

>
>If I do need one, where am I likely to find one? (ie Electronics stores)
>

I think you would be best off getting the manual for your drive. They are usually very short (like one page explaining the jumpers and giving the terminator pack number). You could probably do this by dialing 1-800-555-1212 and asking for the number of the company who made the drive. I have done this several times in the past, and each time the company was more than happy to mail me a xerox of the manual. Alternately, you could call one of the drive specialists in Computer Shopper, and ask what all the stuff means. Either way, you should probably get this info before you try to hook it to your ST.

By the way, if it is a Seagate device, I have a listing of jumper configurations for most of them. Feel free to email if this will help.

You can type "ATA" when the phone is ringing, but this will not work before
the call. The easiest way to do this is to type "ATS0=1", then "AT&W" to
save the configuration (that is a zero in ats0=1, by the way). This
tells the modem to answer on the first ring (S0=2 would be the second, etc).
If it is zero, the modem does not answer at all.

This is standard hayes, so I assume it will work on your modem.

Aren't under-regulated monopolies lovely? Michigan Bell, like Illinois Bell, is owned by Ameritech. Illinois Bell did the per call charge first in Chicago. Now it is implemented all over Illinois. My local charges have basically doubled. Unlimited local calls used to be $5.50/mo. The charges are $0.062 per call (untimed) for calls during the day. This drops to $0.03 per call at night. It sucks. They have the nerve to print: "Volume discount saved you $0.22 this month\n" on my bill....

4114. Bash 1.10 for MiNT 0.9

Newsgroup: comp.sys.atari.st
Date: 1991-11-11 10:24:59 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991Nov11.102459.4447@cs.nott.ac.uk>
Source record: 227599

Just posted to atari.archive is Bash 1.10, in both source and binary forms. Also source for the GNU glob and readline libraries; these are needed to compile Bash. You will need MiNT 0.9 to use this.

The new Bash seems (at the time of posting) to have cured the bug which was causing Bash and ksh to get stopped from time to time; I haven't used it much yet though, and I said the same thing when I first posted 1.05...

It also only really works on Minix partitions; MiNT 0.9 has good support for these, and I have changed over almost completely (I don't have Minix).

Bug reports, suggestions and amusing poetry to me.

> Has anyone else had trouble with the MiNT port of KSH unter MiNT 0.9?

Yes, I have experienced the same problems.

> and if ggascoigne (sp?) intends to upgrade KSH or release his source
> code.

ggascoigne (sp correct) does intend to upgrade ksh, as soon as he gets his hands on Mint v09 and the libs. I have offered to supply both locally (U.K.).

I too have switched to bash for the time being.

4116. Gem View 1.1

Newsgroup: comp.sys.atari.st
Date: 1991-11-11 11:12:03 UTC
From: haacke@exunido.uucp
Message-ID: <3989@laura.UUCP>
Source record: 227600

I post this document for Dieter Fiebelkorn
(fiebelko@petra.informatik.uni-dortmund.de)

Please, send all answers to him!

==========

Actually i am writing the german documentation, i hope to finish it this
week. After that i will translate it into english, this bad english version
will corrected by an english e-mail-penfriend.

Here the CHANGES since GemView 1.0.9:
"""""""""""""""""""""""""""""""""""""

Marl, Oct 12. 1991

Neue Features:
""""""""""""""
- Complett documentation (german and english).
- Runs as program (PRG, GTP) or as accessory (ACC).
- Supports the follows picture formats:
-NEW-> "GEM-View images [*.GVW]" (internal format)
"GIF Images [*.GIF]"
"Sun Rasterfiles [*.SUN]"
"STAD Images [*.PAC]"
-new-> "IFF Imagefiles [*.IFF]"
-NEW-> "MS-Windows Bitmap (*.BMP, *.RLE)"
-NEW-> "OS/2 Bitmap (*.BMP)"
-new-> "GEM-(X)Image Files (*.IMG)"
"GEM-Metafiles (Vector) (*.GEM)"
"Neochrome Rasterfiles (*.NEO)"
"Art-Director Rasterfiles (*.ART)"
"Degas Images (*.P[IC][123])"
"Tiny-Compressed Images (*.TN[123Y])"
"Doodle Monochrome Rasters (*.DOO [640x...])"
"Spectrum 512 Images (*.SPU, *.SPC)"
"X Bitmap-File [*.XBM]"
Will explains in the documantation.
- New functions:
o Identify pictures without loading the picture.
o You can iconify pictures; this meens the picture will saved into
a special format, which is quick in load. This format can reload
any time.
o The LOG-Window contains Icons for 'Load', 'Identify' pictures,
'Open' iconified pictures and to call dialog boxes to preset
some values.

o Fullscreen: Display a picture on the full screen without any
gem-window.
o You can quick zoom a picture two or four times.
o You can quick shrink picture (1/2, 1/4 and 1/8).
o Quick zoom/shrink don't use dynamic memory, (which will not free).
- Growing and shrinking the part of the picture around the position
of the cursor.
- Clip images in all directions (also from down-right to up-left).
- GEMVIEW.PRG have a menuline, you can now use accessories and
- it supports the AV-protocoll (AV_SENDKEY + AV_ACCWINDOPEN +
AV_ACCWINDCLOSED).
- GEMVIEW.ACC comunicate with the main application by AV-protocoll.
(b.e. Gemini).
- Window Cycle (^W) will supported and other windows (AV_ACCWINDOPEN)
will also cycled.
- The ICONS/MENU inside the windows can activate, if the window is
in the background and you can see a part of the ICONS/MENU.
Press the right mouse-button and select the ICONS/MENU with the
left one. The MENU is then a MAC-menu (you choose an entry if you
unpress the left mouse-button).
- Full keyboard support.
- The picture-window contains a menu with full keyboard support.
- Extended INF file with presetting values.
- Faster identify, which picture-format it is.
- Use less dynamic memory as before.
- Some correction.

Version 1.2 (Future):
"""""""""""""""""""""
- Load and Save TIFF (5.0) pictures.
- Supporting MultiGEM.
- Support new picture-formats.
- Faster algorithms for loading.
- Display more than one picture at time.
- Some Tools to convert pictures and printing (can call directly from
GEMVIEW).
- Identify-, Loading-, (Redraw-) and Saving-routines in external
Modules to write special modules by yourself.
- Dialog to choose picture-formats, each fomat will have a separate
Path.

==========

You can get GEM-View from:
""""""""""""""""""""""""""
Dieter Fiebelkorn
Grner Weg 29a
4370 Marl 1 (Germany)
BLZ: 426 610 08
Ktn: 607 984 800

Send a formated Disk, two CRI's (Coupon-Reponse-International),
your address and a message that you want to get GEMVIEW.

GEMVIEW 1.1 is SHAREWARE. Send $20 (US-Dollar) to me if you use GEMVIEW.
Or send $25, than you will get all versions up to version 1.2.

There is a problem with this kind of thinking. Of -course- the computer you bought a year and a half ago isn't as great as the 'newest' thing on the market. And it probably cost as much, or more, than what you could purchase today. However, if you had a -current- need for a computer, waiting for a 'possibly' better (non-existent) computer for the better part of a year or so is criminally stupid.

Almost true. The WD1772 can SOMETIMES be cooled (eg using a Peltier-device)
and work on 16MHz instead of 8MHz. Then it can be used for 1.44 Meg. I _do_not_
recommend the method.

Atari released a new version of the 1772 that is capable of working with
high density drives. At the moment these chips are only available in
connection with a TT. Since the SYSTEMS fair in Munich all TTs are delivered
with the new controller. Let's hope that this chip gets available without a
TT soon.

[stuff about wordperfect 2.0.1, 2.0.2, 2.0.3
for the Mac running under Spectre deleted]

That's nice Gerry ;^) ;^).

I'm currently using WP 4.0 written specifically for the ST and have not, so far ;^), experienced any problems with it.

Its educational price here in Aus is AU$119. Performance for money is quite good. It was worth it just to be able to import and export IBM/IBM compatible files effectively (no dross in the files, just good clean ASCII).

Shane.

>please tell me about them.
(...)
> I've just laid my hands on Paul Moreau's code for accessing SCSI
>tapes through Tar, so when I get chance I am going to incorporate it into
>GNU Tar v1.10.

You should consider to rewrite it or at least modify it. I have looked over
Paul's code during the weekend and found a number of things that should be
changed. No offense to Paul is intended, I'm happy to have his code to look
at and learn from it.

Unfortunately, the tar and driver work ONLY for Archive streamers in QIC24
mode. I couldn't get it to work with my Wangtek 5150 ES at all. At first
I thought it would be enough to modify the resident driver, but there are
device-dependent parts in the C code of the tar utility as well.

I have not tried to compile the tar source for lack of time (and also since
I don't have Mark Williams C -- I guess some changes for Turbo C are needed)
so I can't tell you if it will work at all but I'm confident I'll get some-
thing to work after all :-).

Another thing bothers me: the driver is currently hooked into the BIOS trap,
thus creating extra overhead for every BIOS call the system or a user program
makes. I believe this is A Bad Thing. (Hello Allan P :-)

Nowadays there are more ways to make a driver resident than a BIOS extension.
I'm currently trying to decide between (a) using another trap (say, #6) for
the interface, and (b) not using any trap but a function jump table pointed
to by a cookie.

Method (a) would allow us to use the same mechanism as BIOS and GEMDOS calls,
but would require some housekeeping to check if the trap was in use etc.
Method (b) makes the tape function look like part of the user program, thus
one could pass parameters in registers etc. So I'm leaning towards (b) right
now.

What do people think? I like the idea of a modular driver that several tools
(like tar, mt, cpio, dd etc) could use without having to cram all the SCSI I/O
stuff into each binary. If we do it right lots of wheel-reinventing might
be avoided.

Let's agree on a standard and I'll implement it for Wangtek streamers.
I've set Followup to comp.sys.atari.st.tech since I believe it's a technical
topic.

My apologies to everyone for breaking ksh. I *believe* that the problem is that "close(0); dup(n);" used to be the same as "dup2(n, 0)" in MiNT 0.8, but doesn't work in MiNT 0.9. If this is indeed the problem (I haven't yet obtained ksh to try this) then it will be fixed in the forthcoming MiNT 0.91 (which will also have a kludge in it to allow sozobon and other dLibs compiled programs to work).

(If the above conjecture is incorrect, please let me know ASAP!)

4127. GNU UTILITIES POSTED TO ATARI.ARCHIVE

Newsgroup: comp.sys.atari.st
Date: 1991-11-11 16:34:01 UTC
From: jgj@ssd.csd.harris.com
Message-ID: <JGJ.91Nov11113401@rcx1.ssd.csd.harris.com>
Source record: 227512
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just posted the binaries to the GNU Utilities to atari.archive.
They should show up there before long. Man pages and sources will be
sent later this week or next week. The following is the readme file
that accompanies them:

##

This is my port of various gnu utilities. They are intended for use
under bash1.10, also available on atari.archive.umich.edu. Together,
these give you a rather complete Un*x environment based on gnu software.
The following zoo archives are available. These also include some
non-GNU public domain software.

```
executables source manual_pages
-----------------------------------
file31b file31s file31m
shell13b shell13s shell13m
text11b text11s text11m
misc1b misc1s misc1m
README
```

What do you need to set yourself up? First, you need bash. I
keep everything on disk D: under a directory called gnu. The
following is my directory setup:

```
gnu
bin
gxxinc
include
lib
man
etc
```

Until you have a good feel for how everything works together, I
recommend you use it. Put bash.ttp in \gnu\bin. Now you need to know
about UNIXMODE. The gnu libraries emulate unix style filenames and
symbolic links. If a filename consists of all digits and lowercase
letters and has no more than 8 characters plus 3 character extender,
it maps directly to a TOS filename. Otherwise, a name TOS file is
made up from the real name and an entry in a file called ".dir" is
maintained to describe the mapping. Symbolic links are also recorded
in the same filey. This feature is controlled via the UNIXMODE
environment variable. It is a string of characters for customizing
UNIXMODE operation. By default, bash will set it to "/.,rCLAHdb".
These characters mean:

"/" permit "/" as well as "\" to separate path elements
"." map extra periods to "," when deriving TOS names.
"rC" make root file system be drive C.
"L" permit symbolic links
"A" permit unix style filenames
"H" hide the .dir file from directory searches
"d" provide psuedo device directory
/dev/X is file system x:
/dev/console is CON:
/dev/tty1 is AUX:
/dev/lp is PRN:
"b" open files in binary mode

The only ones you would every probably want to modify are "rC" to
select another file system as root and "d" if you use MiNT. MiNT
users will probably want to use the string "/.,rULAHb". Note that
this must be setup before you run bash. I've included in the readme
archive a program for setting desktop's environment variables that
a stole from a TeX distribution. Note that programs compiled with
the MiNT libraries do not know about UNIXMODE. hence you must
use command lines like
$ bg -o d:\\nohup\\output command string
when using MiNT utilities.

You will want to put all the binary archives (*b.zoo) in /gnu/bin
and than manual pages ones (*m.zoo) in /gnu/man. Now, what all
do you get? The following lists the commands from each utility
package with notes on some of them. Some individual tools are not
ported since their functionality is not available under TOS or
UNIXMODE.

***** README ******
copying -- the GNU communist manifesto
copying.lib -- the GNU communist manifesto for libraries
env.inf -- see setenv.prg
passwd -- sample /etc/passwd (Yes it is usefull. Files pretend to be
owned by user 1. Make an entry for yourself to make ls -l
and some other commands look nice.
profile -- sample /etc/profile. When you start up bash, give it the -login
parameter.
readme -- this file
setenv.prg -- program for setting environment variables from desktop.
I've never used it. I don't have source. Don't tell
me about problems with it. Uses env.inf.
termcap --/etc/termcap used by emacs and some other programs.

****** SHELL UTILITIES 1.3 *******

wc

***** MISC UTILITIES 1 *****

Several of these were already ported, but I wanted them built with
the latest and greatest libraries since a number of fixes have been
done, so I did a new quick and dirty port. Include also are some
non-GNU software. These will receive lower priority as far as
sustaining goes. Send me bug reports anyway.

combine -- best file comparer in the world. Humans can actually
combine2 -- read the output of these and they are great for three
-- way compares when doing merges.
diff
diff3 -- not ported.
egrep
find
fgrep
grep
locate -- not ported
patch
sed
xargs
which -- I wrote this one a long time ago.

mkid -- software package for maintaining database of words from text
lid -- or software soruces. We live and swear by it at Harris.
idx
fid
gid -- symbolic link to lid.ttp
aid -- ditto
eid -- ditto
pid -- ditto
iid

####################

Let me know of any bugs you find. Fixes to them are also appreciated.
These need to be built with at least patchlevel 74 libraries (Which
are not yet (November 10, 1991) available for general consumption).

Ditto here, but fill in (Amiga, PC, Mac, ST, <your fav. machine here>)
in place of "Amiga" above 8).

[stuff deleted]

> It is now official. Newtek has announced realease of the PC MS-DOS
>version of the Video Toaster, for IBM PC's and compatibles. Can an ST

Yes, there is also a Mac version. Interesting thing about these
Toasters is that, unlike the Amiga version, they're not on a plug-in card;
instead, they're an external peripheral. Interesting thing about this
peripheral is that it looks suspiciously like an Amiga 2000 with a Toaster
logo covering the Amiga one....
Yep, the PC and Mac Toasters are actually full Amiga systems with DOS
or Mac software to send ARexx (an Amiga interprocess communications language)
commands from the Mac/PC to the Toaster software running on the Amiga.

>version be all that far behind? Or a mac version, for that matter? Once
>that arrives, along with the Lexicor software, and a 24 bit board, it
>would make one damn cheap video system, even cheaper than the Amiga. And

I doubt an ST version of the toaster, even in it's 'peripheral' form,
will ever show up. Two main reasons:
1) The Toaster hardware is tightly coupled to the Amiga architecture,
and the software is written almost entirely in assembly. It took NewTek
years to design the Toaster for a machine that already had NTSC output;
it's probably just not worth it for them to build a board for any other
system when they can sell their 'peripherals' just as easily without having
to worry about converting scan rates, etc.
2) The Toaster is an NTSC machine with no PAL version planned, according
to NewTek. This leaves out the European market, where most STs are. I just
don't think there are enough STs in use in the US any more to justify Newtek
aiming for them.
On the other hand, there's absolutely no reason why some ST hacker can't
come up with a way to send ARexx messages to the peripheral version, but all
it would be is a front-end to the Toaster to keep the user 'safe' from the
Amiga side.
Oh, and why a separate 24-bit board? The Toaster's already got two 32-bit
frame buffers (granted, they're very _slow_ frame buffers, but they're there...)

>when MTOS comes out, the last claim to fame of the AMI-OS, assuming that
>MTOS is what it is claimed to be, will be gone as well. All this relies

>a bit oin speculation about the Atari side, but even still, it is nice
>sometimes to burst the bubble of the overly pious by reminding them that
>the rest of the world moves on.
>

Hmm... nah, I'll leave this one alone... :-)

>All hail the guru, and the interlace video headache.

Neither are a problem on my 3000 :-).

No, before I get a dozen of the standard replies, I'm not some Amiga user who skims through ST newsgroups looking for openings to flame the ST or its users... I do occasionally skim through c.s.a.st out of genuine interest in the machine as an alternative to MS-DOS and to donations to Apple's legal department. This time I just happened to come across something I felt an urge to reply to :-).

This is a valid point. There is a new version in the works that has a number of improvements (totally new shell, previewer in a GEM window etc) that I'm currently beta-testing. I'll ask Christoph to change his numbering scheme before the release of this new version.

From: cpbuehrer@miavx1.acs.muohio.edu
Message-ID: <7692.291e79c0@miavx1.acs.muohio.edu>
Source record: 227514

I have this ZMODEM program that lets me upload/download files on the VAX. But it sucks...it *never* works on my binary files. There's also an XOMDEM utility on our VAX, but it creates this XMODEM.LOG file that gets to be hundreds of blocks long which uses up too much disk space...exceeds my quota, and then an hour long download aborts with just a few thousand bytes left.

I'm peeved. (and that's putting it mildly!) Can anyone please tell me a nice simple way to transfer files from my Atari 1040 ST with a Supra 2400 modem to the stupid Univ of Dayton VAX?

Since I didn't receive any offers on my complete system,
I'll take offers for the following items individually.

ATARI MEGA 2 - new internal 720k floppy
SC1224 color monitor
Golden image mouse
ATARI SMM804 dot matrix printer (paper won't advance. used to work
great but not any more. I think I have 2 spare ribbons)

SOFTWARE (I Have manuals for the following items)
Timeworks desktop publisher
1st word plus
Masterplan (spreadsheet)
Uniterm (latest version)

GAMES:
Gauntlet
Dungeonmaster (i have a disk with maps also)
Chessmaster 2000
Shanghai
Leaderboard Golf
STart disks - approx 32 disks dating from 1988 to Feb 1991. with
magazines. Many utilities/games!!!!
Current Notes magazine - approx last 2 years

I'll consider any reasonable offers for the above items or if you are
so inspired, make me an offer for everything.

Jim Lynch (jcl7452@usl.edu) W: 318-231-5248

Message-ID: <Ed7j4ze00VICIOjGAa@andrew.cmu.edu>
Source record: 227533

OK. The monitor is the 640x400 mono. It does have an external monitor connection, I use the Video key by Practical solutions so I can use my TV as a monitor, as I have no colour monitor. Works fine. It does not have the RF mod. like the old ST's did, but there are many ways to hook it up, like the Video key. The keyboard is fine. The portfolio's keyboard is cheap :) as is the TT's, but the STacy's seems a bit better than the ST's IMO. Remeber, though, that keyboard appreciation is subjective. The only real misgiving I have is that the function keys and the numberpar were shrunk. But since I do not use them all that much, it is not so bad.
To answer any other questions that might crop up, here is a detailed description:
40mb conner hard drive
ST 840k floppy (thats what I format my disks to, with an extended formater!)
MIDI ports
External monitor port
external floppy port
ACSI hard drive/ Atari laser printer port
serial port
parallel port
Cartridge port (Spectre GCR, yeah!)
MEGA expansion bus, for those cool video cards
mouse port
joystick ports
two button trackball
4 Mb RAM
Uh,..., Hmmm....
I guess that is about it. As you can see, it is basically the same as the ST.

The trade seems fine with me, except for one thing. HOW THE HECK CAN I E-MAIL YOU?! :(Everytime I send to you I bounce. I will try to do it one more time, but If not I will have to post on the net. I doubt we should do it all there, though, so if you can, can you e-mail me your tele no., as you seem to be able to get through to me just fine. My number is 412 422 3983. Let's set this up.

mark

PS One thing I need to concider is how to back up my hard drive. Perhaps I could just do a copy onto the MegaFile before I shipped, If you don't mind waiting, or I guess I can do a 20 meg to floppy ST backup,and a 20 meg to floppy GCR backup. :(

ciao

4135. ST PAD/ GRiD PAD

Newsgroup: comp.sys.atari.st
Date: 1991-11-11 21:43:03 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <Yd7jZb600VICAOjlV5@andrew.cmu.edu>
Source record: 227534

Here at cmu ther is currently a computer expo. On display were the
Powerbook, Quadra, and the Grid pad, among others (NeXT, SUN etc.)
Well, The Quadra blows any TT out of the water, as expected. The
powerbook was nice, and comes with and active matrix configuration with
faxmodem, and two standard LCD versions. They seem quite nice. I have
not seen the ST book, so no comparisons.
BUT The GRiD PAD, one of the major competitors, to the ST PAD,
SUCKS!!!!!!!!! In addition to being an MSDOS machine, All applications
have to be specifically written to take advantage of the Pen technology.
You CAN run normal DOS apps, but with no keyboard, the screen is splitt,
and you get half the screen as a msdos "window" and the other half as a
virtual keboard, where you hunt and peck for the letters. The ST pad
seem to me to be a better implementation, if they can get it out, and if
there are some good software titles written for niche markets.

mark

I recently acquired a copy of Mark Williams C version 3.06. I have scoured the manual to find out how to include in-line assembly code in the C source program, but cannot find any references to it.

Am I somehow missing the part of the manual that discusses it, or does the compiler not support in-line assembler? If you know how to do it or know that it isn't possible, I would appreciate hearing either way. Apologies if I have somehow missed the obvious.

I have a 1772 in my ST which can do 1.44m (actually I have a 1.2 MB 5 1/4 drive connected to my ST). The only thing you have to do is to double the clock rate for your 1772. The problem is, that not all of them can handle with the double clock rate, the first I had couldn't after I exchanged it, the new one could. As I have heard, usually 1772-02-02 can handle with the double clock rate, the one I have now is of that type.

From: nicke@lysator.liu.se
Message-ID: <882@lysator.liu.se>
Source record: 227536

Hello everyone!

A few weeks ago a bought a FAX-modem to my ATARI 1040st, but as always
the software to it was for PC-machines...

Does anyone out there have a Fax-program to ATARI st then PLEASE send it
to me, or tell me where I can get a program.

The best would be if I had a printer-driver for my fax in CALAMUS, and
a dialing-program as accessory. But I dont realy believe that it
exists.

MANY THANKS!

Niklas Andersson (nicke@lysator.liu.se)

|>
|> -- Scott
```

Previously, everyone had the option of paying by the call. So that *no one*
who made few calls had to subsidize those who made many. The flat rate was a
simple way for people who made a lot of calls to pay. $5.50/month was enough to
cover all the calls by all of these people. The move to charging for each call,
then, was in the interest of increases revenues--it was not some great liberator.

When combined with the other under-regulated policies of the phone company, it is
infuriating. What other company do you know of that can charge you $65.00 just
to start doing business with them? Only an under-regulated monopoly could ever try
such a thing.

Source record: 227524

OIn article <JGJ.91Nov11113401@rcx1.ssd.csd.harris.com>, jgj@ssd.csd.harris.com (Jeff Jackson) writes:

[about the UNIXMODE environment variable]
> By default, bash will set it to "/.,rCLAHdb".
> These characters mean:
> [descriptions deleted]
> The only ones you would every probably want to modify are "rC" to
> select another file system as root and "d" if you use MiNT. MiNT
> users will probably want to use the string "/.,rULAHb".

If you're running with Minix partitions under MiNT, than UNIXMODE just gets in the way. You have to use some special options to turn it off -- MiNT users in such a situation will probably want to set UNIXMODE to "/cu". MiNT already has real symbolic and hard links on Minix partitions and on drive U:, and supports long case-sensitive file names -- hence the "c" (turn off case mapping) and "u" (don't try to stuff file names into 8.3 format).

(Actually, MiNT users will probably want to forgo the tos port of bash and the file utilities entirely; Dave Gymer has ported bash 1.10 to MiNT (it will support MiNT job control and running background processes) and I ported the file utilities (which support MiNT 0.9's link(), symlink(), chmod(), chown(), chgrp(), and stat() calls). The only advantage of UNIXMODE right now is that it works on plain TOS disks; the disadvantage is that it doesn't do links properly on Minix or other kinds of disks (e.g. MiNT's drive U:) and it won't work with, say, a UNIXMODE MiNT file system for TOS disks.)

> Note that programs compiled with
> the MiNT libraries do not know about UNIXMODE.

True. That was deliberate -- as I pointed out above, UNIXMODE just gets in the way of the features in the MiNT kernel.

Actually, I rather think that UNIXMODE was the invention of a complete idiot (I can say that, since I'm only insulting myself :-) and an idea whose time has passed. I really, really wish that I hadn't invented it, or at least that I had made the default to be "absolutely no translation" instead of "mangle all the file names into upper case and truncate them to 8.3".

The proper place for symbolic links or for special file name processing is in the kernel. I hear that Edgar Roeder has written a UNIXMODE trap#1 handler -- that's a good idea. And, of course, MiNT is in some sense the ultimate UNIXMODE trap#1 handler, except that I haven't gotten around

to writing the UNIXMODE file system yet (there isn't much incentive for me, since I have several nice big Minix partitions). In principle, it shouldn't be hard, and it won't require a new version of MiNT since file systems are now loaded by MiNT at bootup time.

That's one reason that I recommend using the MiNT libraries for programs now instead of the gcc libraries. The only filename translation that the MiNT lib. does is translating / to \ and vice-versa, and omitting the drive letter from getcwd() when it's done on drive U:. Everything else is left up to the kernel -- so if Atari ever decides to implement a nifty new case-preserving file system with long file names, its hands aren't tied (and even if Atari doesn't, Stephen Henson already has, in the form of minix.xfs for MiNT).

Sorry for the long and somewhat rambling nature of this post. I hope also that it's clear that I lay the blame for the misfeatures of UNIXMODE on my own shoulders entirely, and I'm not trying to flame you or anyone else who chooses to use UNIXMODE; it is useful under (the present version of) TOS, but I generally think it was implemented in the wrong way.

4149. Wordwriter ST / SLM 804 problems

Newsgroup: comp.sys.atari.st
Date: 1991-11-12 05:36:18 UTC
From: bchs1k@menudo.uh.edu
Message-ID: <1991Nov12.053618.5463@menudo.uh.edu>
Source record: 227530

I am trying to use my SLM804 in Diablo630 emulation mode
on Wordwriter ST on a Mega2 system. After running Atari's
Diablo emulation, and loading the Diablo630.cfg (in
wordwriter), I can only print the first page correctly.

All subsequent pages contain overstrike lines (ie: three
lines are printed on top of each other), and stray characters.
Any and all help would be much appreciated...

>|> clock rate for your 1772. The problem is, that not all of them can handle

I recently bought a high density upgrade, consisting of a drive and a board with some TTL chips. It uses 16MHz from the video shifter. I installed the HD drive, but not the modification board (so that means no HD yet), because the documentation said that the original WD1772 works on 16MHz, but in many Ataris (including mine) there is a 1772 manufactured by VLSI, which won't work on 16MHz. So if you have a chip from VLSI, you should replace it before going to 16MHz.

>When one performs such a modification, does s/he lose the ability to do 720K format?
>If so, what is the effect on emulators such as GCR or IBMulators?

Most HD drives can tell whether there is a HD floppy or a DD (720k) floppy in the drive. The modification board I mentioned above switches between 8 and 16 MHz according to this. This means that it is possible in principle to format 720k. Using a HD drive on 720k, however, I have experienced the following problem: When you format a disk which was previously formatted and written to by a `normal' 720 k drive, the HD drive may not be able to erase all the data. This means that you cannot write to the disk succesfully afterwards.
I believe the problem is the head of the HD drive, which is about half the size of a DD head, to accomodate 18 sectors/track (or more). This means that the effective track width is also half that of a `normal' drive, and that data is not completeley erased when formatting.
A possible way to solve this could be to format the disk on 1.44 MB first, to erase everything, and then to format it on 720 kB again. I have not tried this, because I cannot use my HD drive on 1.44 MB yet (due to the controller problems mentioned above).
Formatting clean disks should work. My guess is that IBMulators should work as well (my ATonce does), but I am not sure about GCR.

On the subject of gemini, has anyone got it to work with TOS 1.0

I have a 1 MEG STFM with tos 1.0 and want to know if there is any way
I can run the excellent gemini. Can I get a replacement TOS in software
(hardware is really a little out of my price range) on the PD or has
someone actually changed gemini to work with the older OS?

I appreciate as much info on this as possible. I realise the power of an
ST but also realise that this power is hidden to a great extent by a rather
limiting user interface. Certainly Gemini with the pop up command line
windows etc looks a much better bet.

Also, will gemini work under MiNT? (I have not used mint - having just
recently upgraded, and I am not entirely sure that MiNT does not also
have a replacement desktop).

I anticipate your answers (to me or this newsgroup)

Cheers - Dick

Yes, but it is easy to detect if there is a HD or a DD disk in the drive
and switch clockspeed accordingly (sp?). Generally you should also let the
computer be aware of what kind of disk you're using (bit 6 or 7 of PSG).
Use eg. Fastcopy PRO to format.
>If so, what is the effect on emulators such as GCR or IBMulators?
>
None, if it switch to 8MHz when a DD-disk is in the drive. IBMulators should
be able to use 1.44 Mb disks. (GCR too in the future I think).

4153. Re: HD to TT ? and TOS 3.06 (not 2.06!)

Newsgroup: comp.sys.atari.st
Date: 1991-11-12 11:37:36 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Nov12123736@orion.laas.fr>
Source record: 227538

In the Oct. 25th issue (#91-45) of Z*Net International Atari Online Magazine is the following under Z*NET NEWSWIRE:

DETAILS ON THE NEW TOS!
Atari has developed version 3.06 of TOS for the TT dated September 24, 1991. It will not be available as an upgrade but will soon be installed in all new TT machines in production. This new version fixes previous bugs in TOS 3.01 and 3.05, and a few new features have been added. When first 'booting up' with TOS 3.06 installed, the Atari logo is displayed in the upper left-hand corner. Next it goes through a memory check which is displayed in dashes ('-') and the user is informed of total RAM in kilobytes. A black bar is then drawn across the screen and gets smaller in width as the 2 minute delay timer counts down while the hard drive(s) come up to speed. Finally the system continues as normal; loads Auto boot PRG's, ACC's, and displays the desktop. TOS 3.06 supports the new floppy disk chip which Atari has developed in order to read, write and format 1.44 meg floppy disk drives. A key combination (CONTROL-ALT-something else) places you in the extended character set mode as it does on DOS machines. Atari will also be creating a new version of TOS, with the same features added, for the Mega STE. It, too, will not be available for upgrade, and will only be available in new machines. (Thanks to Jeffrey C. Davis, CEO, Magnum Software)

Since Sept. 24th has come and gone, does anybody have any comments?

The facts mentioned above are true. In Germany all TTs have the new
controller built in and 1.44 meg floppy disk drives.

Well, if you look in the RUS FTP archive at the University in Stuttgart. (129.69.1.12), You can find in soft/atari/lang/f2ps
a converter for the Atari. It converts Fortran 77 to Pascal and C. I haven't tried them myself, but maby someone else has.

(BTW. It's part of a Diplom arbeit from Herman Dupper.

Jarle.

4157. advice on using the STe Parallel Port as a control port?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I am posting this for a friend so this is all the info I have:-

Does anyone have experience/advice about the software side of using the
STe Parallel Port as a bit by bit input/output control port
for lego-like motors and sensors? Is it just a matter of putting a
signal on and doing a read, then masking to get the input bits?
Plus any advice on the hardware side so that I don't destroy the MFP.
Have any PD programs been posted that do this sort of thing?

any replies, by email to me, gratefully received.

No, there is no way with the current version (btw: distributing a patch
would be a violation of the author's rights). Future GEMINI versions
ssibly will run TOS 1.0. But, it's really a better idea to upgrade to a
newer TOS version.

4160. Computer benchmarking

Newsgroup: comp.sys.atari.st
Date: 1991-11-12 15:08:16 UTC
From: <>
Message-ID: <1991Nov12.150816.5094@vaxc.aud.auc.dk>
Source record: 227549

I recently saw a discussion about benchmarks. So I'd like to drop a
few words on comparison between the Motorola MC680x0 series CPU's
and the Intel i80x86 CPU's. Since 1986 I've have had the chance to
test several different compilers for both machines and my conclusions
are *not* quite the same as those expressed by most others people.
I might be dead wrong but then again this is my experiences. My basic
test were aimed at the 68000 versus the 80286, the 80386 should perform
better at same clock rates but then it depends on the machine being
tested. Most 16 MHz 80286 PC's are faster than their 80386 counter parts.

The internal architecture of the 68000 shows a resemblance to the
VAX (Digital) CPU's, both have large (32 bit) general registers,
the 68000 has its register organized in 2 groups, data and address.
In order to fully utilize this chip one should try to keep frequently
used values inside the CPU since this is much faster than using memory.
The 80286 is better at memory <--> CPU acceses. On the other hand, the
80286 has an *awful* set of registers. They are *not* general and makes
programming the 80286 a lot harder than programming the 68000.
On top of this; the 80286 (as the 8086) has segment registers to allow
addressing a 1MB memory in 64K chunks. The 80286 actually has more
hardware and addressing modes than the 80286 but MS-DOS makes almost
no use of this fact (except for VDISK, EMS and hard disk caches).
Standards are indeed a pain in this respect.

The Dhrystone test consists of a meaningless set of functions, executed
repeatedly a number of times. The benchmark measures the number of
'dhrystones' performed per second. This test favors the Intel CPU's
since the 64K segment barrier is not crossed because no large global
data are accessed and the program is most often compiled using a small
code model (16 pointer and memory references). This is obviously to the
8086 advantage. The 68000 can make little use of its registers since the
Dhrystone test keeps entering and exiting functions, most compilers
trashes the registers here.

The test could be made more fair if a) the 8086 used a large code model,
b) the 68000 would be allow to make better use of its registers.
I tried this and the results are *quite* different. Most 8086 compilers
are some 25-30% slower when they switch to the large/huge code model.
To see how much the registers are worth to the 68000, try the Sieve test
with an array of 256K charaters flags (or integers)... the 8086 drops
DEAD here but the 68000 has no problems.

What I mean is: You can't compare these CPU's on the test seen in
magazines. They are too different. The 80286 seems to be better suited
to 'normal' applications and the 68000 performs best with +64K data

like graphics. Nothing beats the 680x0 series when it comes to software graphics. It was never developer for small programs.

As a final note here's the 'official' numbers from the 'official' DHRYSTONE source which is a C program (used to be an ADA program!). The 8086 machine all use the large code model. Notice the difference when using register/no registers:

Machine	Microprocessor	Operating System	Compiler	Dhrystones/sec. No regs	Dhrystones/sec. With regs
Apple IIe	65C02-1.02Mhz	Apple Aztec CII 1.05		37	37
IBM pc/xt	8088-4.77Mhz	Coherent 2.3.43	Mark Wiiliams	259	275
Atari ST	68000-8.0 MHz	TOS	Megamax C V1.0	900	1030
Compaq II	80286-8Mhz	MSDOS 3.1	MS C 3.0	1351	1428
Atari ST	68000-8.0 MHz	TOS	Turbo C 2.0	2000	2000 (1)
IBM PC/AT	80286-7.5Mhz	Venix/286 SVR2	cc	1159	1254
Turnkey	80386sx-16MHz	MSDOS 3.30	Turbo c++ 1.0	3500	3500 (2)
Amdahl 5860	??	UTS sysV	cc 1.22	28735	28846 (3)

(1) The Turbo C compiler uses register whenever possible with exellent results. This explains the difference between the Megamax C compiler and the Turbo C compiler: registers are used!

(2) These are normal figures for 80386's running at 16 MHz.

(3) I recall the AMD29000 microprocessor at 32MHZ delivers some +40000 dhrystones with a 8K cache.

If anyone are interrested I can upload/mail the DHRY.C source but since it has been converted from ADA it is pretty ugly.

4161. MiNT 0.91

Newsgroup: comp.sys.atari.st
Date: 1991-11-12 15:16:04 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1991Nov12.101605.219@uwovax.uwo.ca>
Source record: 227548
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MiNT 0.91 is now available at atari.archive.umich.edu, and has been sent
to comp.{binaries,sources}.atari.st (I had asked the moderator to hold
onto MiNT 0.9 until the newer version was available).

ksh works under this version of MiNT (if anyone knows Guy Gascoigne, please
tell him to change the string "x:/*.%03d" to "x:*.%03d" in the next
version of ksh; MiNT now longer officially supports '/' in place of '\\',
although I did put a hack into Fsfirst so that ksh will continue to work).

Also, programs linked with dLibs (including the sozobon C compiler) will
work under this version of MiNT, so the problems people have noted with
less and elvis *should* go away (let's keep our fingers crossed :-).

Finally, there were a couple of bug fixes, and some streamlining of the
memory allocation functions that should reduce memory fragmentation a bit.
If you've been having compatibility problems with MiNT 0.9, by all means
get the newer version!

4162. Terminal program for TT

Newsgroup: comp.sys.atari.st
Date: 1991-11-12 17:30:58 UTC
From: handl@crypt3.cs.uni-sb.de
Message-ID: <HANDL.91Nov12183058@crypt3.cs.uni-sb.de>
Source record: 227550

Hello,

I need a terminal program for the Atari TT with the following properties:

- runs on a TT with 1280 x 960 monitor

- runs inside a GEM-window, i.e. either creates its own or uses only gemdos-calls so that its output can be redirected into a window by MultiGEM

- vt100, vt2207bit or vt2208bit emulation

- integrated kermit for data transfer

If you know a terminal program with approximately matches these requirements or all except the first but comes with sources, please mail to me or post to this group.

Thank you in advance,

Ralf Handl

sa>There is a PD Hypertext system for the ST already. It was written as a
sa>Diploma project at the technical university of Munich. You can get the
sa>object code from any [german B-)] PD dealer. TUM owns the source rights.
sa>The text entry system is really crummy, but the runtime user interface is
sa>OK. Pity its not an ACC tho ;-<

I wrote a hypertext as an ACC. It is quite simple but written in Assembler. It gets every page seperatly from disk. Its main advantage is, that is uses only verry few memory. I may try to post it ... or simply send me a disk labeld hypertext and include your address and german stamps (or money for stamps 4.10 DM to US. 2.10 DM inside europe).

4165. zoo command

Newsgroup: comp.sys.atari.st
Date: 1991-11-19 20:08:35 UTC
From: boyd@delta.cs.fsu.edu
Message-ID: <1991Nov19.150835.16757@mailer.cc.fsu.edu>
Source record: 227219

Ok folks, I am feeling a bit dense. After reading both the zoo man page
and the "zoo h" help page, I still cannot figure out how to create
a zoo file with subdirectory info intact. My best attempt so far has
been:

zoo aP// something.zoo <directory name to be zooed>

This gives me a zoo file with all files contained in the directory, including
all files in subdirectorys rooted there, but they all extract into one
directory! This baffles me, as it is obviously recursively descending
down the tree, yet does not seem to remember anything on the extract (I
get a flat directory with a BUNCH of files in it).

If I can ever get this to work, I have a couple of very neat software
packages to go onto atari.archive.

Thanks in advance!

P.S. The docs to this program win my personal award for the most ass-backwards
literature I have ever seen.

Extremely old versions of it might be, and there are a couple of PD _demo_ versions out there, but the program itself in it's most recent form is most definitely a commercial product, for which one must pay $$$$'s for.

I hear the price of the latest greatest version has been increased somewhat, so perhaps it is no longer the big price winner as compared to TurboST. However, I think it now performs better than Turbo also.

I think it is possible to fix the media change problem, with a resistor soldered in the appropriate place (or something like that). I remember this being discussed many moons ago on this group, did anyone save it? I am currently trying to get a copy of a file which describes exactly how to do #2 above, so it might contain this info also. I will put it on atari. archive when I get it (it should be called ibmdrive.lzh), and I will post when I do.

Hippo-anything is extremely old, and totally unsupported. I suggest you
get a copy of Prospero C, which is well supported (ANSI too, by the way),
and has the best docs of any ST compiler I have seen (in english anyway).

In which case does a driver not have to generate the 360x360 dpi image. It's pretty clear the bottleneck is the communication and not the mechanism, but I don't know how you can avoid it unless the canon allows some kind of data compression (like the Apple StyleWriter). I have a BJ10e too and to print one page from PageStream takes > 10 min; even a screen dump (half a page at low resolution) takes > 1 min. I am interested to know what graphics program you are using that will print one page at full resolution in ~ 1 min.

Hi all,

Whats the story with the Delirious 2.75 (or should I say 3) and the Dark Side of the Spoon demos. When I boot up Delirious I get bombs at random points in the program - I managed to get past the joystick/keyboard selection screen but then it bombs again. Dark side of the spoon seems to run but the music and display "vibrates" as if it needs to be run at 50 HZ - I tried that too - same result. Do these demos run on 1040STe's??

I am planning to buy myself a C-compiler for
the Atari ST. I have been browsing through some
issues of STUser, where I came across a referance
to Lattice C 5.06.02 by HiSoft. Having great
confidence in Hisoft (thanx to DevPacST), this
compiler caught my interest.

But is this (one of) the best?

Is there anybody out there who regulary use
a C-compiler other than this one and would
like to tell me how good their is?

Or do you use Lattice and want to claim that one
to be the ultimate choise?

Either way, MAIL ME! (Thanks in advance...)

Gosh, I didn't even think most people ever knew Hippo C ever existsed...

What nastalgia, I remember getting Hippo C for my Atari ST and thought it
was the greatest thing since sliced bread, diced, sliced..anyway..TIME HAS
PASSED...

And my how C has grown up into a mature strong Engineering tool on the ST!
I laugh at all my fellow classmates working with the EXCRUCIATING, BAD, NASTY,
HORRIBLE, compiler tools we have on our instructional machines.
(Basically OLD UNIX tools which don't even realize what X Windows is...)

HAHAHAHA, with tools like Turbo C, you can rapid prototype a compiler for
your 536 class...IN NO TIME. (Not too mention the AWESOME satisfaction of
watching everyones mouth drop to the floor
when you hand it in ON TIME, 3 days early!)

I remember all those POOR souls in the labs, with only a printf to track thier variables with...the clock ticking at 1am in the morning...while I would be there just reading rn....(comp.sys.atari.st of course..)
(Everyone who knows me close, agrees. When I don't get my rn, in daily dosages of at least 3 hours....I GET THE SHAKES....!!!!)

AHAHAHAHAHAHAHA, cruel I know, but C certainly has come of age on the ST.

I would recommend buying an ST as a cheap platform to help you get through a comp sci program, just on the basis you could purchase Turbo C/Pure C 2.0 for it.

Spend your time, programming much as you do enjoying life. To do that you need the right tools to begin with....probably the most LACKING feature of any computer science program, as they never teach that.

But I guarantee, if you can't use your ST for anything else, it will teach you how to be an awesome Software Engineer in the most discrete sense of the word.

Just get Turbo C. Then all those "academic waste your time" programs you have to write won't take up much of your time and you can do something useful like making an actual CONTRIBUTION.

After all, thats what the "Science" is all about in "Computer Science".

bobhays@spss.com (Bob Hays) writes:

|Okay, Ken, I'll bite - please tell me more about FONTGDOS, like what is really
|is and where I can find it.

FONTGDOS comes with the FSMGDOS package. It's basically FSMGDOS minus
the outline font stuff. It's more efficient, uses a bitmap font cache,
and supports new graphics functions (like bezier curves).

The bitmap font caching lets you have all the bitmap fonts you can eat
at your beck and call without requiring that they all be loaded into
memory. As long as you configure it with enough cache memory for the
biggest font to fit in memory, the number of fonts you can use at once
is limited only by disk space. Of course if you want the added
advantage of one font file per font, and arbitrary scaling, skewing and
rotation, use FSMGDOS.

Message-ID: <1991Nov20.181745.6006@magnus.acs.ohio-state.edu>
Source record: 227211

I have Quick ST 2.0, and have received the upgrade notice to 3.0. However, I've heard from a couple of other users that Quick ST 3.0 does not speed up a number of the functions on the ISAAC card, which I use. In addition, the even claim that some of the functions, specificly "full-screen color updates?" are considerably slower with Quick ST 3.0 installed than without it! Has anyone out there got some figures on exactly how well quick ST 3.0 works with the ISAAC card in both color and mono mode (with TOS 1.4 of course)?

By the way, you really should read my cool .sig file ;-)

4184. GEM multitasking under MiNT?

Newsgroup: comp.sys.atari.st
Date: 1991-11-20 19:39:49 UTC
From: data3d@aahs.no
Message-ID: <"1339*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 227213

Having thought about making GEM programs multitask under MiNT, I came
to think of a slightly different approach to the problem. Instead of
trying to have GEM handle calls from several programs, one could write
a shell that catches all vdi calls etc. and takes care of it itself.

This way, when a GEM program would try to open a window, the shell would
catch the call and open a window itself. This way, GEM would only see
one program and not get confused about it.

The shell would have to be rather cleverly written, but it really
shouldn't be very difficult to write it. It would have to take care
of who owns the windows etc. and change the menubar upon activation
of the different windows.

Apart from that, you would have to write a shell similar to the one
that comes with MultiGem to redirect output from tos programs into
a window as well.

Anyone with a little knowledge to GEM and MiNT should be able to do it,
myself I don't quite have the time and experience to do it out yet.

Anyone want to have a go at it?

I'm puzzled by this value. What clock are you using that has a 50-Hz
resolution?

> /* NOTE: Properly, the tick rate should be read from the system
> * using "tick = Tickcal();" where "tick" is a long. Future ST series
> * may be different.
> */

The BIOS function Tickcal() returns a long value that indicates the
number of system timer ticks that occur in one-tenth of a second. On a
standard ST, this value is 20. The system timer ticks 200 times per
second.

> Another problem is that the "TIME" definition was used because
> times() isn't supported. On the Atari ST, there's a double problem
> that arises with this. First, the clock resolution is 2 seconds, making
> short test extremely imprecise and in most cases I ran the tests
> 3 times to see if I got more than 1 answer.

The ST has several clocks, and they are by no means limited to a
resolution of two seconds.

The problem is that the ANSI time() function usually is implemented on the
ST by referring to the GEMDOS clock. It is, as you noted, useless for
timing any short-duration event, because it ticks once every two seconds.

The ANSI clock() function is more useful, since it can be implemented
using the system timer ticks as a data source instead of the GEMDOS clock.
(It is unfortunately possible that your compiler's implementors refer to
the GEMDOS clock to get the raw material for this function.)

It's not difficult to get precise timing data from the ST. Here is an
example:

```
#include <stdio.h>
#include <osbind.h>

main()
{
long ssp;
long ticks_per_second, ticks, newticks;

/*
* Get the number
* of ticks per second
*/

ticks_per_second = 10 * Tickcal();

/*
* Get the value of the system timer at 0x4BA.
* This is protected system memory, accessible
* only in supervisor mode. You obtain the
* value by casting 0x4BA to a pointer to a long,
* and then dereferencing it. Some compilers
* provide a peekl() function that does this
* for you.
*/

ssp = (long) Super(0L); /* enter supervisor mode */
ticks = *((long *)0x4BA); /* peek at the system clock */
Super(ssp); /* return to user mode */

/*
* Now perform whatever task
* you're timing. Here we'll
* take a nap.
*/

sleep(5);
printf("This is just to make the value ");
printf("an uneven number of seconds\n\n");

/*
* Get the new value
* of the system timer
*/

ssp = (long) Super(0L);
newticks = *((long *)0x4BA);
Super(ssp);

/*
* Now newticks - oldticks will
* tell us the number of elapsed ticks.
* Divide that by ticks_per_second to
* get a human-readable value.
*/
```

```
printf("Elapsed time: %f\n",
((double) (newticks - ticks)) / ticks_per_second);
}
```

Depends on what you want to spend. I have it (tried to sell it for $10 but nobody bought it!), but since I have Laser C I don't bother with it. It was a pretty limited subset of C, no floats and so on, but it was the only compiler that ran on my 512 with floppy! But now it isn't really worth bothering with, since most of us have more powerful machines.

The P command isn't necessary if you're creating a new archive.

You should use the h switch to get high compression with ZOO 2.1.
If you're not using ZOO 2.1, you should be.

zoo ah// something.zoo <directory name to be zooed>

To restore,

zoo x// something.zoo

(you may have to quote the argument with some shells).

The novice commands -backup and -restore are easier to use. Note that
they are ST extensions and aren't documented in the manual.

ZOOSHELL makes this much simpler.

I connected my ST to a Sparc serial port and ran it with Uniterm as well. All went ok for me. The only difference is that I used (as usual) 8 bits no parity.

I ran into this problem myself, but managed to find a way around it.
What you could do if your program is divided into segments is ditch the
old resource file from memory when you need the new one, and then load in
the new one. When you are done, dump the new one and load in the old
one. This is not a great solution, but it should work. If that is not
an acceptable solution, which it probably isn't, you might have to cut
down on the size of our resource file by using in-code resource files.
Doing this, you can build and then delete the resource file as you need
it. This is easy to do from Personal Pascal, but I haven't seen any

other compilers that can do it. I know that there are resource construction sets that can analyze the resource file and then write out the C code to make it happen without the file, but I haven't seen any of these either. None of these solutions are particularly appealing, but there really isn't any graceful way around the problem...

You get this error when an executable file isn't executable anymore. For
example, a corrupted program file will give this error. Another common
one is TOS error #35. You could simulate the error by renaming a text
file to a .PRG file. The error will be generated. Good luck...

4191. 16MHz Vs Blitter

Newsgroup: comp.sys.atari.st
Date: 1991-11-20 23:32:27 UTC
From: au036@cleveland.Freenet.Edu
Message-ID: <1991Nov20.233227.12591@usenet.ins.cwru.edu>
Source record: 227224

Is it just my machine or can the 68000 in 16MHz mode with cache enabled outperform the blitter on a Mega/STe. Enabling the blitter actually slows down the machine for certain operations. Using Quick Index 2.2, the following tests were slower with the blitter enabled in all 3 resolutions:

- TOS text
- TOS string

And in medium resolution the "GEM Dialog" test was slower with the blitter enbled.

When Quick ST 3.04 was installed, enabling the blitter even slowed down some operations in 8MHz mode for medium and low resolutions.

The worst slowdown was with the "TOS text" test in medium resolution. Quick Index 2.2 gave a rating of 155% of an STe with the blitter disabled, and only 111% of an STe with the blitter disabled. Enabling the blitter slowed down the machine by 44% of an STe, which is a 28% slowdown. In other words, the machine will operate 40% faster with the blitter disabled. This doesn't seem to match the claim in the user manual that the blitter greatly increases the speed of text and graphics operations, and may need to be disabled because it could make software run too fast.

Does anybody know if this is the way the Mega/STe is designed or if I just have a strange machine?

The following are the results of testing the Mega/STe with Quick Index 2.2:

High Resolution without Quick ST 3.04

	TOS text	TOS string	TOS scroll	GEM dialog
16 MHz with cache	(+37) 151%	(+31) 152%	(-15) 86%	120%

4192. ghosting in mono mode on multisynch

Newsgroup: comp.sys.atari.st
Date: 1991-11-20 23:34:25 UTC
From: wmagro@firenze.uiuc.edu
Message-ID: <1991Nov20.233425.24083@ux1.cso.uiuc.edu>
Source record: 227225

I just bought a multisynch monitor and manages to get all three resolutions running on it. Low and medium look great. High resolution, however, shows ghosting after each black pixel to white pixel transition. The 'ghost' is 1.5 to 2 pixels wide, and is a light gray in color.

I am feeding the mono (TTL) signal into the analog input of the monitor (I feed it into red, green, AND blue inputs). Although my monitor has a max horizontal rate of 34 kHz, it synchs to the 35 kHz mono signal fine.

The input on the monitor is 75 ohms, as it is on the SM124 (which doesn't ghost).

Anyone who has seen this problem? Also, anyone who has run a multisynch in mono and had it look fine, please send me your cable connections and a description.

Thanks a ton, and please hurry, my eyes are starting to hurt!

>resolution?

The figure was in the Lattice manual. It wasn't important. The
HZ is only used if the TIMES code option is selected in the Dhrystone.
If you use the TIME option it's actually ignored. If the figure was
wrong I would have noticed it when I did a manual timing and calculation
and I would have discovered the discrepancy. I didn't. . . .

...

>The BIOS function Tickcal() returns a long value that indicates the

>resolution of two seconds.

Yeah, but again, the rule of thumb I went by was to make the
least alterations to the benchmark code (or as I usually say "do the
least violence" to the code). It wouldn't effect the speed measurements,
but it invalidates the code size comparison if you start making major
re-writes of the code. Also, there's a point in seeing how the code
handles "a standard program source". This tells people how much work
they can expect to do to port a program. On the one hand, you want

to find out "if I make minimum changes can I live with the results?"
as well as "how much work do I have to do to end up with a good program?"
Your suggestions aren't "wrong", but don't overlook the value of the
tests I posted in that respect. The timing code included in the
Dhrystone in the TIME and TIMES options is the most commonly used
"standard" timing code you'll find in Unix C/ANSI C programs. Can
you use Lattice C on the Atari ST to satisfactorily port standard C
programs or is it really a matter of having to "rewrite programs from
the algorythms?" If timing is a part of the program, maybe you can
live with it or maybe you'll have to rewrite--you decide. :-)

>The problem is that the ANSI time() function usually is implemented on the
>ST by referring to the GEMDOS clock. It is, as you noted, useless for
>timing any short-duration event, because it ticks once every two seconds.
>
>The ANSI clock() function is more useful, since it can be implemented
>using the system timer ticks as a data source instead of the GEMDOS clock.

I didn't bother looking in detail. But the problem stems from
the fact that the TIMES option looks for "sys/times.h" which doesn't
exist in the Lattice C compiler. I could probably have made the
necessary modifications, but then again, ...
Again, it's a matter of how much rewriting do you do to the code, and
at what point does all the modifying reduce the value of the benchmark.
You're not wrong, but the choice I made was "the least violent."

>(It is unfortunately possible that your compiler's implementors refer to
>the GEMDOS clock to get the raw material for this function.)

It's unfortunate that Atari, ... :-)

>It's not difficult to get precise timing data from the ST. Here is an
>example:

... [omitted the example. It's good, but no point in repeating it.]

There have been postings seeking C compilers with source code
debuggers. The Lattice C package has source code debugging if you
use the integrated compiler. It's pretty good, but requires a lot
of "resource" (either lots of RAM or a hard drive or equivalent) if
you're working on a large project. In essence, it's good to use during
the early stages of a project, if you only have 1 Meg and 2 double
sided floppies (the minimum Lattice configuration). Also the compiler's
limited in its support of modular development. I haven't used the
complete package lately, but I remember some minor problems trying
to get it to compile "changes" without recompiling unnecessary pieces.
The bottom line is that I've opted to use a Make utility and MicroEMACS
rather than the integrated compiler for most of my work. However,
I'll emphasize that I really do like it during the early stages of
a project.

That is what confuses me. Since Richard Miller is VP of R&D for Atari Computer Corp., why would he comment on the design of arcade games? A recent Znet article stated that Atari Computer and Atari Games were unrelated except for by their name, so unless Mr. Miller has an evil twin brother, then maybe the Computer Design authors meant to say that an "arcade-style" machine was being developed?

Source record: 227233

Of course, if MiNT had sockets (which it doesn't (yet?)), the shell would just have to listen for connections from the pseudo-VDI calls made by the programs.

This "shell" could actually be a device driver built into MiNT with a socket, as many such device drivers are done in Unix.

This article is, of course, pure pie in the sky as MiNT hasn't currently got this functionality.

One of these problem is that the Atari put out some 1 volt pk-pk,
and the sandard is 0.75 volts..

From what I can remember you connect 22/27 ohm resistors 1/8 watt or small
ones, in series with the R.G.B inputs of the monitor, do this at the monitor
end, inside the plug..

4201. TT 1280x960/Overscan

Newsgroup: comp.sys.atari.st
Date: 1991-11-21 12:30:51 UTC
From: <>
Message-ID: <1991Nov21.123051.15537@vaxc.aud.auc.dk>
Source record: 227242

Hi netters,

I need some technical info regarding display memory organization
on ST with 1280x960 and the TT's 1280x960 (monochrome modes).

The following describes the layout for the standard 640x400x1
display memory on a ordinary ST (in case you don't know it):

```
Video base -> +---- 640 -----+
| |
| | 400
| |
+--------------+
```

The display is organized in 40 words (640 dots) by 400 scanlines
giving a total of 80x400 = 32000 bytes allocated to the screen.

I have the Overscan modification in my ST and with my multisync
this gives me 736x480x1 (still momocrhome) laid out as:

```
Video reg base -> +--------------+---+
|XXXXXXXXXXXXXX|XXX|
Visible image -> +---- 736 -----+---+
| |XXX|
| |XXX| 480
| |XXX|
+--------------+---+
|XXXXXXXXXXXXXX|XXX|
+--------------+---+
|
+-- Overscan area (X=black)
```

Video reg base == Physbase()
Vissible image == Logbase()

When Overscan is activated the DE (display enable) signal is
force on by a small hardware modification thereby continuing
to feed information to the monitor at the end of the normal
640 dot scanline. At one point the monitor can take no more
and the catode ray beam returns to the left edge (horizontal
retrace) still reflecting the data sent thru the Shifter in
the ST. A software patch changes the Line A variable to see
the larger screen area and colors the non-displayable area
black so the retraces wont be seen. A SM124 can only take
16 or 32 dots more but multisyncs normally shows 720-736
horizontal dots. All monochrome monitors shows 480 scanlines.
The actual screen image is 43K but the physical memory used

to generate the picture is 51K so there is a small vaste.

(My setup gives me 736x480 and cost $3 for the Overscan components and $225 for a monochrome multisync so I can't complain - I think Overscan should be a standard ST feature!)

NOW the question!

- What is the layout of the 1280x960 Moniterm?
- What is the layout of the TT's 1280x960 resolution?
- Are they (software) compatible
- Do they emulate the 640x400 (software/hardware)?

Please E-mail me at: soren@tequila.vlsi.auc.dk

Btw: There is also a official AutoSwitch Overscan which works similar but has more software options.

Thanks in advance....Soren

It's not hard to emulate that kind of use of sockets with MiNT pipes;
the shell program could create a pipe named "AESSHELL", and clients could
send messages to this pipe requesting a private connection (on a new
pipe the shell creates; it sends the name of this pipe back to the client
as a response).

Personally, I think it would be better to make the client a child of the
shell, since then the shell can manipulate stdin and stdout so that if
the client does character I/O it ends up in a GEM window. But that's
my taste; and I guess that GEM programs aren't supposed to do character
I/O anyway.

4203. Mint boots Gem from wrong drive

Newsgroup: comp.sys.atari.st
Date: 1991-11-21 12:59:42 UTC
From: oli@math.rwth-aachen.de
Message-ID: <oli.690728382@ernie>
Source record: 227236

Hello everybody.

When I boot mint w/o mint.cnf, it boots up Gem, but from Drive C: instead of G:, where I boot mint from. This is very inconvenient for me, since Acc's and Newdesk.inf on C: are very different from those I want to use under mint. The AUTO Folder, of course, is read from G:. Is there a way to work around this?

Oliver

4204. Mgr or ksh swallows square brackets.

Newsgroup: comp.sys.atari.st

Hello.

If I start a TOS program from a ksh in an mgr window, where mgr itself has
been spawned by a ksh, I can't send any of the keys []{}@\ to the program.
They are reached using ALT or ALT-SHIFT and an umlaut key. Funny keycodes
are read instead. The ksh itself is capable of using those characters.
If the program is run from the initial ksh, however, the keys can be used
normally. This happens if 'vt52' is running or not. Does anybody know
what happens and how to fix it?

Oliver

> ||| Atari Corp. System Software Engine
> / | \ #include <disclaimer>

Thanks to Ken for that description and for the other info he puts out here.

As ever, I wonder when we're going to see FSMGDOS. I'm sure Ken would like it to be out now, but here we have to contend with good ol' Atari UK. If past performance is a guide:

a) The UK subsidiary won't get it until after a lot of other places (the first Mega STE's for sale have *just this month* reached these shores, would you believe!)

b) They'll then sit on it for a year, wondering how to package it and whether to sell it or give it away (cf. what they did with the Epson emulator for the SLM804 laser)

c) They'll sell an outdated version - meanwhile, Atari USA will distribute an updated version as freeware (Epson emulator again - you can still adverts selling v1.00 for 29.95 pounds, around $50, and at the same time you can collect Laserbrain v1.31 from the PD libraries).

Timeworks Publisher 2 is due to be shipped from early December. It has support for FSM GDOS built in, but the last I heard was that it will initially be released without FSM GDOS because FSM won't be available in time.

I'd love for this information to be proved wrong. However..

Cheers,

Graham

4208. Falcon question.

Newsgroup: comp.sys.atari.st
Date: 1991-11-21 19:38:00 UTC
From: CCSCHR@UWOCC1.uwo.ca
Message-ID: <0690739445@uwovax.uwo.ca>
Source record: 227247

I have Falcon 1.1 and it's two extension scenario disks (CounterStrike and FireFight).

When I was last at my dealer's store I noticed he had an updated version of the original Falcon disks which he offered to update my originals either for free or some nominal charge (I don't recall). I believe he indicated this was Falcon version 2.1.

He also talked about how copy protection had been added to this level and that the code wheel was no longer used. He also implied that some special (hardware dependant method was needed to copy the new disks properly to avoid trashing the disk due to the nature of the copy protection). Well he didn't learn his lesson too well in that by the time he got around to copying the deisks for me, his orginal disks were already broken.

Can anyone confirm ... Is there a Falcon 2.1 released?
What is new about it?
Has the copy protection changed?
Given that the disk is copy protected, does this
mean the updated Falcon code can not be used
as the basis for the flight characteristics
for the advanced scenarios?

The only reason I am questioning the dealer is that he has a history of being way too busy for his own good, the result being that many of the day to day details tend to get greatly confused.

Thanks all!

CHR.

Source record: 227248

Does anybody out there know (this probably means you, Mike) if
DC DataDiet will compress .snd files? This would be very
nice! I was reading about DataDiet in STInformer, where the
writer says that DataDiet will compress any data file and then
lists a variety of types that it WILL compress...but .snd
files are not included. So, it is hard to determine whether
or not .snd files will work.
Since .snd files are so large, compression on the fly here
would be very beneficial.

|> Hi all !
|>
|> I am currently using an 1040ST, but I want to upgrade to a TT/030
|> I have a couple of questions about the machine before I go to my
|> dealer, who just wants to sell....
|>
|> 1: Is the TT sold without a Hard disk ?, or have all configurations
|> a hard drive installed ?

me: Normally a Seagate 157N1 (48 MB)

|> 2: Can I add my Quantum 105Mb SCSI drive to the system without making
|> serious hardware modifications (other than opening the machine, and
|> connecting the drive)

me: Local dealer may sell TT`s with Quantum drives, if wanted,
or without any drive. (so you can plug in your Quantum)

|> 3: Can I use my standard atari monochrome monitor (SM 124) with the TT
|> if yes, in all monochrome resolutions ? or just the ST modes ?
|> What monitor do I need for the color modes. Can a 'standard' multisync
|> VGA monitor do the job ?

me: As I know you have to buy at least a standard VGA monitor to
get run your TT`system (means : SM124 is useless !)

|> 4: How to add memory ? Do I need SIMMS or SIPPS, and which speed ?
|> can I just add memory by plugging in a couple of 1Mbyte / 70 ns
|> SIMMS ?

me: No SIMM`s not possible. You need special memory cards for the TT.
If your are in Europe (pooor US) there are several cards on the market.
Up to 256 MB !

|> 5: How's the new TOS ? what's new ? (from 1.4) besides those funny icons ?

me: New things like the sound (as ste), the new graphic modes, ...
The new Destop : putting Icons on the background, something like grep in
the windows, ... (I haven't got one yet)

|> 6: The machine has a 1.44 Mb disk drive. Can I write and read 360K and 720K
|> floppies reliable ?

me: Are you sure of the HD? If so you can read all what have at least
80 tracks, 9 sectors , 1 side (normal one-sided disks) up to
82 tracks, 21 sectors, 2 sideds (unnormal HD disks)

|> 7: About UNIX :
|> The whole world is full of rumours about it. Is it available ?, if yes
|> Is it stable ? how much disk / memory does it take ? has it X ? are there
|> compilers for it ?
|> Is it an Additional product (ie. can I buy it later) or do I need to
|> buy it preinstalled with my system ?

me: as I know preinstalled (read news : Why ASV is a dead ...)
a good, violent, flaming discussion about your question ... ;->

|> 8: How about compatibility? Does all TOS software (all serious software I mean)
|> run ?

me: Don`t know what`s serious to you (At least: most of non-pd do run)

|> 9: What's the keyboard like ? Is it much better than the 1040 ? and compared
|> to the mega STs keyboard ?

me: like MEGA ST or better (I hope !)

|>
|> Thanks a lot for answering. Your answers will sure help me make my choice.

4215. Code for Spectrum Display?

Newsgroup: comp.sys.atari.st
Date: 1991-12-18 17:00:37 UTC
From: stevendd@mentor.cc.purdue.edu
Message-ID: <29569@mentor.cc.purdue.edu>
Source record: 227254

Has the code for displaying a Spectrum picture been released into public domain? Or is it licensed to various programmers? If its in the public domain please send it to me or post it. If its licensed to programmers please post any info about obtaining a license.

Thanks, Doug

4216. Re: Mail server @ terminator?

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 01:01:24 UTC
From: brode@icpsr.umich.edu
Message-ID: <1991Dec19.010124.8879@terminator.cc.umich.edu>
Source record: 227329

In article <95679@bu.edu> selick@bucsf.bu.edu (Steven Selick) writes:
>I was just wondering if there was a mail server for the atari files at
>terminator.cc.umich.edu that are available via ftp.

Yep, send a message to atari@atari.archive.umich.edu with a body of "help"
and you will get instructions for using the mail server.

Jon

4217. 3am Downloading (was Re: umich archives)

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 02:44:19 UTC
From: bigham@acpub.duke.edu
Message-ID: <683@news.duke.edu>
Source record: 227276

Little did I know what I was getting into when I wrote in <666@news.duke.edu>:

> [...] I set up an `at' job to download a lot of
>files at about 3am, and they all came through fine.

Several people have written to ask How I Did It, and since this may well be of interest to others, I figured I'd post it. If you disagree, hit `n' now.

Still with me? Okay, the following assumes that you're on a Unix system with FTP access. It may also be a bit oversimplistic for some, but better to be oversimplistic than overcryptic.

1. If you haven't already done so, create in your home directory a file named .netrc with the following line:

machine atari.archive.umich.edu login anonymous password <your e-mail address>

or add said line to an existing .netrc. This will log you in automatically when you connect to a.a, and is thus useful in its own right.

2. Create a file (say `infile') containing the ftp commands you'd normally use to download files; for instance:

```
binary
hash
cd atari/games
get wizard.arc
cd ../mint
get mint092b.zoo
[etc...]
```

3. Create another file (say `cmdfile') containing the single line:

```
ftp atari.archive.umich.edu < infile > outfile
```

4. Type the command:

```
at 3am cmdfile
```

At this point you might get one of two errors. `at: Command not found' or similar means your system doesn't have an `at' command. Oh well. `at: Permission denied' or similar means that on your system, only certain users are allowed to use `at'. Talk to the local system admin about getting added to the at.allow list. If you get a cryptic number back, you've succeeded; that's the ID number of the `at' job you just created.

5. Check back tomorrow. If it worked, you should see all the files you requested, and a file named `outfile' containing a sort of "transaction log" -- most or all of what you would have seen had you been running ftp

interactively.

Note that the `3am' parameter can be made more elaborate -- `at 4am thursday',
for instance. Type "man at" for more information.

If you have questions (or if I've made mistakes), I'm just an 'r' (or an 'f')
away.

4218. Atari 520ST Systems $350

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 03:50:37 UTC
From: sandy47@ucsco.UCSC.EDU
Message-ID: <25477@darkstar.ucsc.edu>
Source record: 227271
Cross-posted to: ba.market.computers,misc.forsale.computers,comp.sys.atari.st

I've decide to sell my 2 spare Atari 520ST Mono systems which have
been mainly used (lightly) for Midi activities. Details as follows:

Atari 520ST Monochrome System (2ea.)
(very good condition)

-Atari 520ST computer
w/power supply, mouse, manual

-Atari SM124 Monochrome Monitor
w/power cord, cable, manual

-Atari SF354 Single Sided Floppy
w/power supply, cable, manual

Price: $350 per system + shipping costs

Much software can be added to make this more interesting
to you as a buyer, inquire within...

Please contact me by email reply to this article or at:

4219. wanted: recommendations for educational programs for 9-year old

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 16:49:06 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <3993@tekig7.MAP.TEK.COM>
Source record: 227283

Well, here it is Christmas again, and once again I find I've purchased another disapppointing program for the kids. I've got a bunch of games, which they enjoy, but whenever I try to get something educational, I get something that, when I actually play with it for a little bit, I realize is going to hold their attention for about 15 minutes, tops. Another $30 down the drain. Part of my problem is that my local dealer has practically no children's software, and I don't like to order something sight unseen without a recommendation.

An example of something I think they *would* enjoy would be something along the lines of, say, "Mixed-up Mother Goose", but where they have to answer math or other questions to get the object to continue the search. Examples of what I think they *won't* like are what I just bought: Bentley Bear's Math Magic I, which after you've played a minute, you realize is just flash cards with animation, and it's never going to get any more interesting.

Any suggestions (other than telling me to dump the ST and buy a PC)?
Pointers to magazine reviews would be helpful, also.

Thanks.

4220. v17INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 19:07:08 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <kl1resINN952@exodus.Eng.Sun.COM>
Source record: 227250
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 17, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@twitterpater.eng.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@twitterpater.eng.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!twitterpater.eng!atari-binaries. Note that
comp.binaries.atari.st is not the correct place to ask general questions
or to ask, "Does anyone have software that does X?" Post such requests to
comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Please include a description of your program at the top of your article.
Look at old issues of comp.binaries.atari.st for examples of the sorts
of descriptions I'm looking for. I don't write the descriptions at the
tops of the articles; what you see is what the submitters gave me.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this means
```

arc, zoo (including 2.1), and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v17INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v17i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 17. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v17i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
zoo-high - program is a zoo 2.1 high-compression archive (zoo21 req'd)
lharc - program is an lharc archive (lharc required to unpack)

high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 17, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

4221. v17INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1991-12-19 19:07:18 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <kl1rf6INN955@exodus.Eng.Sun.COM>
Source record: 227252
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 17, Info 2
Archive-name: Index

Files listed below can be requested from the Atari archive server,
archive-server@twitterpater.eng.sun.com. Send it a mail message containing
the word "help" for information.

Note: When requesting files from the archive server, replace the last "/" in
a file's path with a space, i.e. volume1/turtle part01. You may request
several files from the same directory (volume1/turtle part01 part02 part03).

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: August 13, 1991

_1. _W_e_l_c_o_m_e _t_o _c_o_m_p._b_i_n_a_r_i_e_s._a_t_a_r_i._s_t!

Here you'll find a wealth of software for your Atari ST, from games to spreadsheets to compilers -- all free and yours for the taking. This document describes exactly how comp.binaries.atari.st works, and tells you how to get started. Don't worry if some of this seems complex; it'll all become clear after a little use. The section "Getting started" at the end of this document is worth reading if you're new to all this. It gives you (reasonably) step-by-step instructions for obtaining the software you'll need to get going.

_2. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_2._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_2._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown together.

Using Binaries -2-

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_2._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_3. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site twitterpater.eng.sun.com has all the binaries stored in its archives.

The other way to get binaries is to request them from twitterpater's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

Using Binaries -3-

To find out more about the archive server, send a mail message containing the word "help" to archive-server@twitterpater.eng.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@twitterpater.eng.sun.com to report the problem.

There are other archive sites, too, such as atari.archive.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as atari.archive, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp atari.archive.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that twitterpater does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Twitterpater also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@twitterpater.eng.sun.com if you'd like to sign up.

_4. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

Usually, things are been small enough to fit in one article, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX

systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text

_____
|- UNIX is a trademark of Bell Laboratories.

editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. A new version of zoo, 2.1, is in volume 15 of the binaries archive. You'll need the old version of zoo to unpack the new one. Zoo 2.1 is necessary to unpack "zoo-high" format archives (look at the Keywords: line of the article you're unpacking.)

To extract lharc files, you should first try the program "lhx104" in volume 15 of the comp.binaries.atari.st archives. It's not in compressed

form, so all you'll need to do is uudecode the .TTP file. It will unpack .LZH files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_5. _G_e_t_t_i_n_g _s_t_a_r_t_e_d

A version of uudecode written in ST BASIC is available in twitterpater's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). To obtain it, send mail to archive-

server@twitterpater.eng.sun.com, with the following message body:

send sources/volume1 basic-uud

The archive server should reply quickly (the actual amount of time it takes depends on how your site is connected to the outside world) with the BASIC program. Take off all the mail headers and introductory text (everything above the line that says "10 ' UUDECODE PROGRAM") and bring the file to your ST using your communications program. (Refer to its documentation for specific instructions about that; every program does it in a different way.)

Once you have basic-uud, you should get all six parts of the program "starter" from volume 16 of the binaries archive. The "starter" program, when run, writes out copies of the utilities you'll need to start decoding and unpacking comp.binaries.atari.st articles. Send six more mail messages to archive-server@twitterpater.eng.sun.com, each with one of the following requests:

send binaries/volume16/starter part01
send binaries/volume16/starter part02
send binaries/volume16/starter part03
send binaries/volume16/starter part04
send binaries/volume16/starter part05
send binaries/volume16/starter part06

You need to send separate mail messages because some mail systems won't handle very large pieces of mail, and if you requested all six parts at once, you might never see a reply!

Copy all six parts of starter, in order, into a single large file. Then go through and edit out the extra text between parts. Everything between (and including) the "include" line at the end of a part and the "begin" line at the beginning of the next part should be removed. (Blank lines are bad, too; everything from the "begin" at the top of the first

part to the "end" at the end should be a solid row of 'M' characters along the left side, except a couple lines above the "end.")

Use the BASIC program to uudecode the resulting file, then run starter.tos. It will write out copies of arc, zoo, lharc, uue, and uud (all described above.) You're ready to begin!

_6. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

> floppies reliable ?

Be sure to get the 1.44 Mb drive only the newest models have them and be
sure to get TOS 3.06 inside, since that one will support 1.44 Mb drives

>7: About UNIX :
> The whole world is full of rumours about it. Is it available ?, if yes
> Is it stable ? how much disk / memory does it take ? has it X ? are there
> compilers for it ?
> Is it an Additional product (ie. can I buy it later) or do I need to
> buy it preinstalled with my system ?

UNIX is only available to developers at the moment, don't expect user version
before spring 1992 (that is what I heard from Atari)
It takes 80Mb disk space seem to run stable an satisfactorly. It is delivered
preinstalled on a large HD (210Mb or bigger) which can be bought later and
installed. I am not sure if the Unix disk (which is a SCSI) must be the internal
SCSI unit 0 and how you can choose between TOS and UNIX at boottime.

>8: How about compatibility? Does all TOS software (all serious software I mean)
> run ?

Should be 95% (games excluded), the other 5% is either already updated or
flaky anyway

>9: What's the keyboard like ? Is it much better than the 1040 ? and compared
> to the mega STs keyboard ?

Seemed to be quit plesant

PS. I do not own a TT it is al just what I heard and was able to try/see
at several occasions.

Okay, I didn't think I'd get all my instructions right the first time. Add the
following step to my previous instructions, after step 1:

1a. Type the command:

chmod 700 .netrc

This denies read and write access on the file to everyone but yourself.
If you fail to do this, you'll get the error:

Error -- .netrc file not in correct mode

ftp is thoughtfully pointing out to you that you may have sensitive
password information in a file that everyone can read.

Thanks to davidd@binkley.cs.mcgill.ca for pointing this out to me.

4230. ATSpeed and fonts (screen)

Newsgroup: comp.sys.atari.st
Date: 1991-12-20 07:40:51 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Dec20.074051.17723@rodan.acs.syr.edu>
Source record: 227268

Many of you may not be interested in this post...sorry about that. But I've got a question about how the screen fonts work with ATSpeed that nobody has been able to answer. I've asked the tech support person at Talon (now Medionix, or something like that), but I've never gotten a clear answer about how it works. So, I thought I'd bring it up in this forum, which frequently provides answers that one can get NOWHERE else.

ATSpeed is an msdos emulator that uses a 286 chip. It does a very good job with this emulation, but what it cannot do is emulate hardware it doesn't have, e.g. a video board with ram for screen fonts, etc. I really needed something that would let me insert screen fonts because I work with a program that puts Russian characters in the upper ASCII codes, in place of the Greek characters that are normally there. Then I use a keyboard program that lets me switch between typing Russian and English. Well, I can do this with ATSpeed, because while it does not have vidoe memory, it comes with a program called Speedfnt.com that allows you to load a new font to replace the regular screen font. So, I load my Russian font (which normally gets loaded into a vga or ega board, if you have one) with Speedfnt, load my keyboard driver, and everything works fine.

Here's the problem. When I use WordPerfect 5.1, sometimes I will see the Greek characters in place of the Russian ones when a certain high-lighting occurs...It is as if my loaded font is bypassed and the original font is somehow accessed. Is there anyone out there who knows why this occurs, and/or if there is a way to keep it from happening? It is not a WordPerfect particular thing, as I have seen it occur in other programs as well...

Any help in this area would be greatly appreciated.

You now have ONE choice of screen accelerator for the ST... (see the CodeHead announcement where they offer to upgrade owners of TurboST, even though the company is gonewaha.. dead as a dodo, AvanteGarde, Practical Solutions and STart magazine)

If you want your ST's display to run faster, you can ignore Darek's "attitude" and buy Quick ST, or you can "boycot" it and plod along at 1985 speed...

That's my point about the pitiful state of the Atari market... it's shrunk to the point where there ARE no choices..

Steve.. I'm assuming that if you withdraw your money from your nasty bank, there's at least one other in your town to deposit it in..?

Not the case with the Atari market.

Suppose you decide you don't like Nathan's girlfriend, and Deron's ties are too loud... what are you going to do for Desktop Publishing software..?

I don't buy anything made by General Electric Company because I got fucked over by one of their divisions, but at least I have other choices for telephones and stereos... if I want to speed up my ST screen, I buy Quick ST or nothing.

If I could buy another Atari computer from a company NOT run by the Tramiels, you're damn right... I'd buy it from them in a heartbeat.

Guess how many Atari computers I've bought from the Tramiels since 1986...?

> add a field in the basepage and last start the loaded image with
> Pexec (mode 4). Everytimes, I do so, I get an exeption #3 BUSERROR ...

... stuff deleted

I guess the problem could be that Pexec 4 requires the adress of the basepage
(as returned by Pexec 3) as 3rd parameter in the function call.

So in C it is done like this:

```
int example( char *name, COMMAND *cmd, void *env )
{
void *bp; /* or other as appropiate */
int res;

bp=(void*)Pexec(3,name,cmd,env);
if((long)bp<0) return (int)bp; /* load error */

/* do something with the loaded code */

res=(int)Pexec(4,NULL,bp,NULL); /* important COMMANDLINE argument */

Mfree(bp); /* since the memory is owned by this process, we have to free it*/

return res;
}
```

likewise is assembler (only the call):

```
clr.l -(a7) ; environment dummy
pea (a3) ; assuming bp is held in a3
clr.l -(a7) ; name dummy
move.w #4,-(a7) ; mode 4
move.w #$4b,-(a7) ; Pexec code
trap #1
lea 14(a7),a7

pea (a3) ; bp adress
move.w #$49,-(a7) ; Mfree (actually I'm not sure about the number)
trap #1
addq.l #6,a7
```

I tried this procedure lately using TOS1.4 by I positive that this
scheme hasn't changed since the very first versions.

I hope I have helped with this reply (and that it becomes an reply at all).

Alexander Lehmann (THD).

p.s. I'm very sorry about the first (empty) reply. I can't handle vi at all.

Actually, I still use TurboST every day, and am quite satisified with
it. If you can find a store selling some of the older software (say
like MicroTime, in my home town :) I would think that TurboST could
still compete with Quick ST in this market. Perhaps Quick ST has finally
become faster, but up to now I've still heard about more compatibility
problems with it than with Turbo.

>If I could buy another Atari computer from a company NOT run by the
>Tramiels, you're damn right... I'd buy it from them in a heartbeat.

I believe that there are both better and worse people than the Tramiels
to run a company. I'm amazed that they've been able to stay out of
bankruptcy over the last few years, marketing a machine that wasn't
PC-compatible. I think it's too bad that you would go purchase machines
on a brand name so quickly, when you seem to place such importance
on the character of the people running the company. Please, don't
ever purchase something in a heartbeat which runs the risk of making
you whine for years afterward.

>
This is 100% true, but the original post I made asked if, considering Darek's attitude, whether someone would buy his GEMulator for the PC considering his wonderful attitude. NOT if they would buy Quick ST. Hell, I own Quick ST and it's not a bad product. Part of the reason I got it was the price, which was also the reason I have an ST instead of something else.

>If you want your ST's display to run faster, you can ignore Darek's

Awww..... c'mon. This has nothing to do with likes and dislikes on that level. Perhaps when I said "atttitude" I should have probably added, "attitude towards his customers". Before I post next time, I'll consult a thesaurus. Or a lawyer.

This way, Nathan Potechin's love life won't be involved.

4241. Re: Help on SCU-unit needed

Newsgroup: comp.sys.atari.st
Date: 1991-12-20 15:14:26 UTC
From: rxf@reto.stgt.sub.org
Message-ID: <4115@reto.stgt.sub.org>
Source record: 227259

In article <1127@ahx.hobby.nl> leo@ahx.hobby.nl (Leo Weppelman) writes:

>[..]However, when I try to
>access the unit on the addresses where it is suppossed to be, only bus-errors
>result.
You MUST use the odd adresses !

Following Bits are used:
in 0xFF8E01 sys_mask
Bit-Nr(== IRQ-level) comes from Vektor
7 _SYSFAIL in VMEBUS Autovektor
6 MFP programmable
5 SCC programmable
4 VSYNC autovektor
3 not used
2 HSYNC autovektor
1 System Software INT autovektor
0 not used
TOS initialises this with $14 after Restart

in 0xFF8e03 sys_stat
same as above

First read sys_stat, because reading sys_mask resets the pending
int-bits in sys_stat.

in 0xFF8E0D vme_mask
Bit-Nr(== IRQ-level) comes from Vektor
7 _IRQ7 from VMEBUS programmable
6 _IRQ6 from VMEBUS/MFP programmable
5 _IRQ5 from VMEBUS/SCC programmable
4 _IRQ4 from VMEBUS programmable
3 _IRQ3 from VMEBUS/Soft programmable/auto
2 _IRQ2 from VMEBUS programmable
1 _IRQ1 from VMEBUS programmable
0 not used
TOS initialises this with $60 after Restart
MFP-Int and SCC-Int are hardwired to the VME-BUS-INTs (or'ed)

in 0xFF8E0F vme_stat
same as above
Also read stat first (see note above).

in 0xFF8E05 sys_int
setting Bit 0 to 1 forces an INT of Level 1 (Vektor in RAM at $64)

in 0xFF8E07 vme_int
setting Bit 0 to 1 forces an INT of Level 3 (Vektor in RAM at $6C)
Both INT must be enabled in the xxx_mask registers

0xFF8E09 and 0xFF8E0B are genereal purpose register, they do nothing,
you can use it to store any value.

I hope, this helps !

Reinhard

I just uploaded the demo version of Atzenta 2.20 on a.a. It should be
available to the public rsn.

Here is a brief description of the program (taken from the manual):

ATZENTA is a complete personal information manager featuring a powerful,
but easy to use, interface for organizing phone/address databases. Contrary
to the classic card-based approach, this program is capable of displaying
and manipulating multiple files and records on the same screen. Operations
such as dialing numbers, copying and moving records among different databases,
locating a record with just a key-stroke, protecting databases with passwords,
and much more, consist powerful tools hardly found in other programs of its
class. In addition, using the built-in Calendar, one can calculate the
difference between any two dates, find the weekday for a particular date, and
keep daily memos for important events and appointments.

The demo version is identical to the official one, except that it does not
"Save". A usable demo of version 2.09 can be found on a.a also.

enjoy.......

writes:
>Is it possible to compile a version of gnuchess on an Atari ST?
>Is it something special I should know before I try? Do you have
>to have curses (or X) to get a "graphic" display of the pieces?

It is possible, and an earler version has actually been ported and posted
to comp.{binaries|sources}.atari.st; check nearby ftp sites for availability.

Compiling gnuchess should be fairly trivial otherwise, if you get the
GNU - C port for the ST; it includes an implementation of the curses
library.

Both should be available via anonyous ftp from atari.archive.umich.edu
[141.211.164.8], for example.

Hope this helps

The TT does not have an Ethernet Interface!
The builtin high-speed Net-Interface in not yet supported by Atari :-(.
(Its AppleTalk-like, I heard.)

You can insert an VME-Bus Ethernet-Interface, but do you have Software?
I heard some rumors about expensive interfaces from german vendors,
the same vendors which sell (bad) ethernet interfaces for the Mega-ST ...

Uli

Having looked at pym's fractal generation, if this is in fact on-the-
fly- as they say (and I have no reason to doubt it!) this is excellent!
I am currently working on a math graphics type intro program that will include
fractals as part of its features... and would beinterested in knowing just
how many folks out there would be interested in seeing a package that
allowed one to explore in general a number of interesting math graphics
functions, or what folks in general would like to see in this area.

Has anyone played the full implementation of "Megalomania"?

I have a demo of it that was in ST Format, and thought it was pretty
good. Any info would be appreciated, including:

o Ordering info for U.S.
o Does it support a 2-player RS232 mode?
(aside- wouldn't a 16 player MIDI mode be great!?)
o Any other thoughts or comments

i can confirm that GNUchess compiles and runs just fine "right out of the box", with gcc and lib/curses that come with it.

cheers,

|I tried to E-Mail You, but the system here would not accept your Address,
|well is there a version of GSZRZ that can do ARCV, as I have Big
|problems using it with Batch uploads, can only get some 3-4 files at a
|time, I do have Version GSZRZ18 that I think was posted to GEnie..
|
|Or can the Author help, is there a version that can work in the
|background, and supports ARCV and not just the command line..??
|
I haven't used it much, so I don't know what to tell you on that subject. I didn't put together the archive at Terminator, I just downloaded it as you did, but haven't messed with it much yet. I did notice the PFXing, so I passed the info along. Another thing I recall that might help is whoever put that archive together said he took out the RZ and SZ programs that came with it and put in a newer version (1.7). Well, I myself would like to know what version came with it originally. Because, newer is not neccessarily better. For example, I can use v1.4 with MiniBBS, but v1.7 locks it up. When you run the two, they say they are based on different code. I have never seen v1.8, maybe you or someone else will send it up to atari.archive for us poor folks who don't have GEnie accounts. Have you tried XYZ 2.01? I don't know if it will run in the background, but I've used it for batch uploads/downloads and it works fine. Anyway, thats all I know. Maybe your problems will be solved when Rufus 1.10 is released. Someone posted that it was going to be released real soon, and suggested that we not mess with v1.06 since it was coming out so soon. Well, I hope so, but I've have 1.06 for a couple of weeks now and there is still no sign of 1.10, time will tell... Mark.....
(Oh, BTW, another friend had trouble sending me mail here, he ended up having to use the bang path, you might try that if you want to send me some mail in the future....)

4259. MEGAFILE 44 HELP NEEDED

Newsgroup: comp.sys.atari.st
Date: 1991-12-21 16:57:17 UTC
From: Mark.Spacek@fquest.FidoNet.Org
Message-ID: <693355394.1@fquest.FidoNet>
Source record: 227260

I'm posting the following for a local friend who doesn't use Usenet. Any help would be appreciated. Either post it here or e-mail me, people have told me that they are having trouble getting mail to me and are having to use the bang path to get it through though.... Anyway, on with the show

---

Okay, folks, got a problem someone may be able to help me with, I hope. I've recently gotten a Megafile 44 Syquest cartridge drive. For the most part, it works just fine, but it's got a couple quirks. When I try to run DLII (which is a sector editor, file defragmenter, undeleter, etc.) the machine just locks up. Most of the time it locks on the bee, but sometimes I get 2 or 4bombs. This happens whenever the Syquest is connected, whether the program is run from the HD or the floppy. The second problem program is with Cheetah, the fastest darn file copier around. There are no problems copying between HD and floppy, in either direction, but if I try to copy between folders/partitions on the HD, try to create folders on the HD, or delete files, the FAT seems to get scrambled, the system can't find the files that were copied, and I lose the space that the copied files occupies. The only way to free up the scrambled space is to zero the partition.

These problems occur if I take my Megafile and hook it up to someone else's machine with a different version of TOS, and different RAM amounts and expansion boards. However, everything runs fine if I take my Syquest cart and try to run the programs from a unit with an ICD host adapter. This makes me think that the problems are due either to compatibility problems with the Atari host adapter in the Megafile, or some defect in the HA or the Syquest drive itself that will need repairs. Does anyone out there have a Megafile 44 and use these programs? If so, do you have the same problems, or should I get my unit to a repair shop before the warranty runs out?

Any assistance, hints, or information would be greatly appreciated. I don't really want a hard drive that works fine for everything except two of the most useful programs I use. (BTW, the Syquest is my only HD unit, it's running on a 520ST with an AERCO RAM upgrade to 2.5 Megs and [yes, I've still got it] TOS 1.0). Thanks a lot.

Thats the plea for help he posted on a local BBS. Once again, thanks in advance for any help.... Mark....

4260. RE: HERMES UUCP PACKAGE

Newsgroup: comp.sys.atari.st
Date: 1991-12-21 17:10:12 UTC
From: Mark.Spacek@fquest.FidoNet.Org
Message-ID: <693355394.2@fquest.FidoNet>
Source record: 227256

Hi, I tried sending you some mail inquiring about the mailing list you mentioned and tring to see what help I could get in trying to set up Hermes. I never got a reply. I don't know if the mail didn't get through or maybe you didn't get around to replying or maybe the reply didn't get through. A friend recently tried sending me mail and didn't get it through until he used the bang path, so thats possible. I know the mail used to work fine here, but there might be a problem with it for now. SO, I thought I would post this publically. I can verify if it gets out or not and hopefully stand a better chance of getting a reply. If you do see this, did you get my mail? I was asking about setting up Hermes to run as an event under BBS Express!, we are thinking about bringing in the ST Usenet messages, converting them over to the local message base format, and possibly converting outgoing messages back over for export. It might be too tough to do, but we thought we would try. As I said in my mail, any help would be appreciated. Oh, BTW, what do you know about the Usenet Mercury news groups that I've seen mentioned here. Do you get them? A friend of mine with an account at the University of Texas looked around and they don't get anything like that there. Just wondering...
Mark....

> the same vendors which sell (bad) ethernet interfaces for the Mega-ST ...

Try PAM-Software, Carl-Zuckmayer-Str. 27, 6500 Mainz-Drais, Germany.

They sell VME-Bus ethernet-interfaces with either their proprietary
net-software or IPX-drivers to attach the TT to a Novell server or
TCP/IP-driver to attach it to whatever you want.

I've had some experiences with these and they're not bad at all, IMHO.

Cheers, Paddy

P.S. I don't get paid for this statement but I'm reselling these boards,
just to be fair ...

4263. WANTED: Dr. T's K1 editor or Hybrid Arts GenEdit for ATARI ST

Newsgroup: comp.sys.atari.st
Date: 1991-12-21 19:38:36 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <12352@vela.acs.oakland.edu>
Source record: 227325
Cross-posted to: rec.music.synth,comp.sys.atari.st

I am looking for a used copy of either GenEdit by Hybrid arts or a K1 editor
for the atari ST. If I do not find either, then I suppose that I will have
to hack one out, but in the meantime, if anyone has a copy, it would be
most appreciated.

4265. Updated TeX Instructions

Newsgroup: comp.sys.atari.st
Date: 1991-12-21 21:12:32 UTC
From: lehmann@cs.tamu.edu
Message-ID: <7175@tamsun.tamu.edu>
Source record: 227323

Well I moved back to Austin Texas during a 5 day rain storm that is still continueing. In the move the motor to my floppy drive was damaged. Everything works on the drive by the disks won't spin.{

Because of this, I cannot use my recently acquired 60MG hard drive to install several TeX configurations.

Any suggestions about makin the floppy drive work will make the updated instructions come out faster.

I am looking into getting a new internal floppy drive, but I don't know where to buy one and I don't know how difficult one would be to install. Can someone send me some suggestions of places to call to order a new drive. Also, does anyone know the price of a new drive?

If you know of a place in Austin Texas that sells these things, then I can get the new documentation out even faster.

Merry Christmas everyone,
Happy Hanukkah to those of the Jewish faith,
Happy Session to those of other faiths,
Happy weather to those of no faith.

From: chu@acsu.buffalo.edu
Message-ID: <1991Dec21.222718.6968@acsu.buffalo.edu>
Source record: 227320

Hi,

I just downloaded the tcsh port as well as version 18.57 of GNU Emacs from atari.archive.

Can someone please give me a Termcap entry that'll allow me to fully use tcsh (i.e., arrow keys, at least?) as well as convince Emacs that my terminal (i.e., the Atari ST) is powerful enough to run Emacs?

Or is there something more serious that is wrong (i.e., common mistake during installation?)

Please reply by email.

thanks

John

(Sorry, absolutely irrelevant, but I just got an STe and it seems Uniterm is not quite compatible with it. Can anyone suggest a replacement? It has to support full VT100 emulation and kermit.)

4267. SofT for sale...

4268. CASSETTE INSERT MAKER FOR TEH ST

Newsgroup: comp.sys.atari.st
Date: 1991-12-22 05:08:49 UTC
From: wcsanil@superior.carleton.ca
Message-ID: <1991Dec22.050849.4925@cunews.carleton.ca>
Source record: 227258

THis is my second post requesting a cassette insert maker for the ST.

Surely one exists! I've seen excellent programs for just about every other computer. Please respond via email to wcsanil@ccs.carleton.ca if you have one or know of one.

This is ridiculous! THere's such a drought of ST software it scares me. There was a bigger abundance of good applications software for my old 8 bit by the looks of things (and hell, I had a great cassette insert maker for the 8 bit!).

Anil Prasad

Source record: 227265

Hi,

I'm going to be sending a letter off to the leaders of Atari
Corp. in the U.S. I was wondering if anyone had any comments they
would like me to include.

The main purpose of my letter is to convince Atari to include
some things in the next generation of STs that they are building now.
There seems to be always a drawback somewhere in the machines that
they produce and I don't want to see it happen on these new computers.

Anyone have any ideas of what Atari should include with the
new STs to help give Atari an edge in the music market besides MIDI ports?

How about desktop publishing?

Video production?

Multi-media?

Education?

Small Businesses?

I believe if Atari includes some special features to help it
out in each of these niche markets, these new STs should do very well.

Does anyone know the fastest speed Motorola based computers
can go without using fast-RAM?

In the entertainment market, I think making the new STs
Jaguar compatible will help enough.

I thought about asking Atari to consider the ST Book's MIDI
expansion hardware to be put in future machines like the Mega STe.
I thought of an overscan mode with built-in genlocking for video
production. I thought of separate graphics and sound processors to
help with multi-media. And networking for education and small businesses.

What is your thought--write me back. Also, include any
information about things you'd like to see a revised TT/030 or the
new TT/040 have.

THANKS.

Len

4271. MIDI connections on the ST

Newsgroup: comp.sys.atari.st
Date: 1991-12-22 07:34:04 UTC

Message-ID: <1991Dec22.073404.27876@rodan.acs.syr.edu>
Source record: 227257

I've got a question that I don't think has been discussed before (probably for a lot of reasons, including that the answer is most likely really obvious if you know what is going on). I've currently got a Translator One hooked up to my MIDI port (this is the old product developed by Dave Small that allows an ST to read Mac-formatted disks), but am toying with the idea of getting a MIDI keyboard to use with my ST. Can I simply daisy-chain a keyboard to the Translator One? or do I need to do something more complicated...say, alternate plugging in the Translator One and the keyboard (depending on what I want to use) or perhaps buy some kind of switch that will allow me to leave everything connected but will require me to switch between devices (sort of like monitor master for monitors)?
Thanks very much for your response.

4273. ST FORMAT GAME DIED: Imagework's INTERPHASE

Newsgroup: comp.sys.atari.st
Date: 1991-12-22 14:08:40 UTC
From: unknown@disk.uucp
Message-ID: <1991Dec22.140840.27560@disk.uucp>
Source record: 227275

I just purchased an ST FORMAT game called INTERPHASE. The store I bought it from only had the disk, w/o the magazine, but it was really cheap, so I bought it. :) Anyway, it turned out to be an amazingly good game, really commercial quality. But after three succesfull boots it stopped working. It just goes to the low rez desktop. When I checked the disk-info box, there were all zeroes except for an 8 that was one line below the last line (it had no heading, just an 8). Well, I'd really like to get another copy of this game. How do I do it? Do I send in my orginal disk and they replace it, or do I just order the ST FORMAT January 1991 issue? And what is there address? THANKS!!
Also, I'm looking to get starglider 1 and 2... Could anyone tell me where to get these, how much they should cost, and if they come in any package deal? Thanks again.. :)

4274. Prices and places: 520 ST to 1040 STe or 2M STe

Newsgroup: comp.sys.atari.st
Date: 1991-12-22 14:19:57 UTC
From: unknown@disk.uucp
Message-ID: <1991Dec22.141957.27648@disk.uucp>
Source record: 227316

What would be the best way to upgrade my virgin 520 ST to an STe
and add 1 or 2 Meg of memory? Please include names/addresses with
any prices you may have, since I don't know many Atari dealers.

I really need at least a meg of memory for Lattice C. I would
also like to get the STe TOS. How much do each of these upgrades
cost? If I get the new TOS will it be compatible with just any
memory upgrade? Any other recommended courses of action? How
much just to max out the ST at 2.5 meg? And will I still be able
to upgrade my TOS later?

If I get, say, a meg of memory, and I get that disk based PC
emulator, about how fast will it run? (how slow? :) And how
compatible is it? Or, going the other way, where can I get alot
of 8-bit emulation programs (Atari 8-bit, CP/M, ANY others?)

THANKS alot!!! Please Respond Via Email...

>
> If you want your ST's display to run faster, you can ignore Darek's
> "attitude" and buy Quick ST, or you can "boycot" it and plod along at
> 1985 speed...

Unless I've missed something recently (which is possible), Turbo ST is still available, even though it's not currently being enhanced. I originally bought Quick ST several years ago, and was disappointed by numerous screen glitches in a few of my heavily used applications. So I switched over to Turbo ST and have been very satisfied.

I called the Turbo ST people a month or so ago to inquire about compatibility with Auto-switch Overscan, large screens, and the new crop of graphics boards that are surfacing. Wayne returned the message I left on his machine the same day.

Since Turbo ST has no immediate plans for such support, I got an update to Turbo ST 3 (which does). I've only been using it for about a week, but it seems pretty solid so far. So if and when I upgrade to better graphics, I won't give up screen speed. But for those still running the standard ST rez screens, Turbo ST is still a worthy alternative.

Another choice you've omitted is NVDI, out of Germany, available here in the States from Rio. I've heard good things about it, but haven't tried it myself. I understand it also builds in a number of other enhancements and system fixes as well.

So, I disagree that (this particular) situation is as bleak as you've painted it. How many screen accelerators do you think the Atari marketplace requires to prove that it's a viable platform?

> I don't buy anything made by General Electric Company because I got
> fucked over by one of their divisions, but at least I have other
> choices for telephones and stereos... if I want to speed up my
> ST screen, I buy Quick ST or nothing.

When I switch over from using my ST in Atari mode to Mac mode, I notice that screen draws seem a bit slow. Bob, could you give me a (presumably long) list of the screen accelerators available to replace Quickdraw?

I have no argument with Bob that the Atari marketplace is not in good shape, or that things couldn't be a lot better. I'm an Atari developer myself, and if there were a lot more machines being sold in the U.S. I'd be doing proportionately better. I just think he's picked a poor example to make his case.

I can tell you about dBMAN version 5.1 which I have been using. I
just ordered the upgrade to version 5.3, but it hasn't arrived you.

>Is Dbman a relational db?
Yes.

>What is the user interface like?
It's a lot like dBASE. It's really intended that you write dBMAN
programs to implement your application, but there is an interactive
command mode with a lot of powerful operations for creating, editing,
and printing databases. There are also tools to help in the
generation of screen and report formats.

>How many tables can be linked?
10 in version 5.1; 50 in 5.3.

>Does if support SQL or something like it?
No.

>Does it have a good compiler to create standalone applications?
Yes.

Source record: 227286

Interphase was a commercial game costing around 25 UKP. It was put on
ST Format as a freebie cover disk program. It's fairly unlikely that ST
Format will be able to help as it's not their program.
As for Starglider 1 - This doesn't work with later ST's so check before
you buy if at all possible. I think the games OK up to TOS1.4 though.

KAOS, the alternative OS is a commercial product. But this applies only
for the "genuine" OS itself (i.e. ROM-files etc.).

Some utilities like KAOSDESK may be copied and distributed.

Greeting,

Thomas

I have recently uploaded version 1.3 of RTEXSHLL to atari.archive. This may come useful for those wanting to run a minimal TeX system. One bug present in the presently available version is removed & some new features are also added. Look for file RTEXSH13.ZOO in directory atari/newitems (initially) and later in directory atari/tex/shells.

4285. FTP dir on dsrgsun.ces.cwru.edu

Newsgroup: comp.sys.atari.st
Date: 1991-12-23 15:04:00 UTC
From: semra@ral.arc.nasa.gov
Message-ID: <23DEC199107041563@ral.arc.nasa.gov>
Source record: 227328

Hello,
I've only tried to post once before and I don't even know if that one got out. I've been trying to access dsrgsun.ces.cwru.edu for access to the atari archives that are (were?) there. I'm unable to get a directory after an anonymous FTP login. It seems that there is a /pub/atari directory, but I can't see what's in it. I assume that it's set up that way for security reasons. Which brings up my questions:

1. Are there still archives there?
2. If there are, how do you find out what's there?

Email replies to semra@ral.arc.nasa.gov and place my name (Don George) in the reply as this is a shared account. Also, since I don't know if my posts are going out or not, could someone please reply anyway. Let's set a time limit of about a day to reply, that way I don't get bomarded with replies from now until doomsday (not too likely, but you never know). Thanks for the help.

I guess I need to make up a sig one of these days.

4286. problem unpacking c.b.a.s articles

HELP HELP HELP

This is a strong cry for help!
Problem: All arrived encoded archives are handeled badly bad appropiate unpack program (arc6.02 and arc521c, xlharc(Shroka's version1.2, zoo2.1 and zoo2.0)

I use the decode program: uud version 3.4 25-nov-1988

I also have a self extracting archive that refuses to unpack because my TOS (1.4 on a MegaST 4Mb) refuses to recognize it as a program.

Any ideas why all unpackers suddenly seem to be incompatible with their own archives?
Before a few months ago I never had any trouble at all I always had some archiver that was able to unpack the things I received and as far as I know I have all the different versions of all unpackers of the last 4 years!

What uudecode program should I use Steven?

Please reply by email!

4287. Re: Quick ST support

Newsgroup: comp.sys.atari.st
Date: 1991-12-23 16:55:40 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1991Dec23.165540.4359@digi.lonestar.org>
Source record: 227292

My opinion (flame away if it makes you feel good):

I have Turbo ST and am quite happy with it. Although I was curious about QST3, I *definitely* would not buy it from D. Mihocka (sp?). Yes, his consistently poor attitude does make a difference to me. However, now that the CodeHeads are responsible for QST3, I *will* upgrade from Turbo ST. Mind you, I don't "need" to, but I do want to support the CodeHeads. I just hope that the amount of $ that goes to DM (if any) is kept to a minimum! :-)

Happy Holidays to all!

Roy C. Gosewehr

I take it you're talking to me. I did send you mail, got no bounce.
I've tried testing a bang path. Let me know if it works.

> ..I was
>asking about setting up Hermes to run as an event under BBS Express!, we are
>thinking about bringing in the ST Usenet messages, converting them over to the
>local message base format, and possibly converting outgoing messages back over
>for export.
I don't think this would be the best way to do this. Too many
problems arise when you try to juggle message formats, and errors can
make you very unpopular. The monthly " Some FidoNet site's dumping garbage
on the net again" threads are very enlightening in regards to much damage
can be done by software that assumes too much.
A far better solution, IMO, RCSU, would be to write a doors interface
to Mercury, and flesh out the bare bones rn and elm that came in that
package. BBS Express uses a very C like script language, so if you can
handle that, C shouldn't be much of a leap. You need to keep your
Usenet mail and news very clean nowadays, as the major hubs are using
C news, which is getting stricter and stricter about what it'll pass.
Articles have been dropped on the floor for a misplaced comma in the
header.

>..... Oh, BTW, what do you know
>about the Usenet Mercury news groups that I've seen mentioned here. Do you get
>them? A friend of mine with an account at the University of Texas looked
>around and they don't get anything like that there. Just wondering...
I think the mercury groups are a German only distribution, and
you'd have to get your admin to get uunet or someoone who gets the groups
to forward it to you.

TO ALL PLANNING TO SAT UP A UUCP SITE, HOWEVER SMALL.

Read the news.admin group regularly for a while. There also
will hopefully be a new group called news.transport(s), which you'll
need to follow. These groups let you keep up with what's happening
in news software, and by running a uucp site, however small, you are
an admin, and should keep current on what's going on.
I found out there that a recent change to Cnews had tightened up
on Date: header parsing, and all my messages were being dropped on the
floor. (Thanks Matthew)

Re: Mailing Lists. The response has been small, and Hermes doesn't make mailing list administration easy, so it's a no go. However, I've agreed to provide NA support, for what little I've figured out so far, and will refer any thing I can't explain to Martin. This is for Hermes, as I no longer use Mercury, plus the English doc available for Mercury are quite good.

>
>What graphics cards are available and what software will support them?
>(I have a 1024 * 768 colour Multiscan monitor).
>
>Does the Dave Small 68030 board work in a Mega STE?

Last question first, no, it doesn't. George Richardson, of the Merlin Group who designed the board, said that Dave wants one for the MSTE, but there may not be enough room in the machine for one. If he is able to get one made, he said that you shouldn't expect it within the year.

As for the first question, there's the Matrix cards from Germany. There's also AlberTT (1024x768 w/ 16 colors from a palette of 4096). It's VDI-compatible, so it works with a lot of stuff, like DynaCADD, Calamus SL, etc. Finally, there's Leonardo24: 512x512 with 16 million colors; it will show as many of those 16mil as you can fit on the screen (512x512=262,144 colors). First 50 are $400 from Lexicor. It will run on an SC1224 or SC1435 or multisync monitor. Has NTSC output.

I've been given a 1040STf that was in pretty bad shape - it was disassembled, missing the power cord, missing the mouse, and the DSDD internal drive is not working. I re-assembled it, found a spare power cord, and hooked it to my monitors (color & mono) - it seems to work fine except for the drive. Anybody happen to have a 1040STf DSDD internal drive (the one with the eject button in the lower middle) they want to part with. I also need a mouse but I don't want to spend 40 bucks or so on a new one??

Source record: 227312

I have been getting some e-mail on the letter I'm planning to
write Atari but I would really like to talk to you guys online.

If you have telnet access, try logging on the Cleveland Free-Net.
The system has multi-user chat. We can get our heads together and
write Atari a letter. I know it will get through because it has in
the past. I know this because I talked to the person who got it and
he quoted me things from it.

Once we write the letter, we can say to ourselves, "HEY! We told them
what we wanted, if they screw it up, we can't help them!"

You would telnet to 129.22.8.75

If you can't get in with that address, I'll find another one.

If you don't have an ID already, I don't know what to say. It takes about
two weeks and I am hoping to have the conference this weekend or
something.

And if you forgot what my letter was about, it is a letter about what
we would like to see Atari's new ST computers have. I've been told
they are still under development so we can still get in our suggestions.

Thanks.

P.S. That is NOT an FTP number. Telnet and FTP are different.
Len

I don't think so.
Several months ago, I found an old version of KAOSDESK on a local BBS.
I asked on the MAUSNET if this was a legal copy (it didn't contain any inidication of being PD or Shareware) and got the answer that it _wasn't_!

KAOSDESK is a sold as a commercial product for 19.80 (plus S&H).
I really don't think there is a PD version.

CodeHead Software in the US will be selling the TOS 2.06 ROMs separately from their TEC board for those whose STs will handle the ROMs directly.

Give them a call at CodeHeadquarters AFTER Christmas week for pricing information: (213) 386-5735

Their US Snail address is: P.O. Box 74090, Los Angeles, CA 90004

...
> 1. Are there still archives there?

No. NO. NO!

There are no archives for the Atari ST on dsrgsun.ces.cwru.edu. Remove this Internet address from your Atari-related FTP lists. The person who maintained files at this address has MOVED ON. It was removed from the comp.sys.atari.st 'Welcome' posting a long time ago for that simple reason.

I.E. You're wasting your time.

If you want U.S. access to the most complete archive, use the Internet address atari.archive.umich.edu ... see any of the monthly postings which cover the atari.archive server.

Howdy all,

I have a problem or two... I have a couple of games and a few programs
that I would like to run, but they are color only. Now what I would like
to know is if anybody knows of any color emulators that run on the STe
with Tos 1.62? I have tried bigcolor, emumontr.lzh, omni-res, and
emula 5.1. None of these seem to work. I get various problems with each.
I have gfacolor.prg, but it only does low resolution. Any ideas out there
on the net?

John.

Hi,

My dear brother owns an Atari 1040ST and suddenly experienced some
weird problems. As I do not operate any Atari myself, I'm not familiar
with the symptoms, but I have verified the situation.

About a year and a half ago, I upgraded his machine to the new
TOS (probably old by now) which enabled drive to read and write
IBM compatible diskettes. Everything worked fine.
But all of a sudden this stopped working. The diskettes the
Atari produces are unreadble on a PC. I had to run Norton
on the floppy to 'repair' it. Norton claims the disk have
a wrong media descriptor byte. I thought that was the problem
with the old TOS!

Any clues? I'm baffled!

Steve Whitney@flatcat.wp (1407)

> Yeah, that's like saying, "The service at my bank is terrible, I think
> I'll pull
> my money out." Ridiculous, ism't it, Bob?

No it ain't. It's like saying that my bank gives me poor service and a
shitty interest rate, and there is another bank that has ok service, but
who are rude, and have a high interest rate.
Atari has poor perfomance compared to QuickST, and the service to users
from atari is a joke. just try to call them or email them with a
question. Dereck has had good support for his product, and his product
has GREAT performance. Some feel he is rude. Bob's point is... SO WHAT?.
I agree. if quick ST has had good support in the past(it hs) and if it
is cheap (it is) and if it is good (it is) then to not buy it on account
of the views of the programmer, while valiantly moral, is a bit foolish.

Actually, Turbo has just about always had more compatibility problems
than QST, aside from taking a valuable .ACC slot (Thanks DRI for only
giving 6) Also QST has always been faster, in the contemporary release,
than Turbo. I know, I've used many incarnations of both, and have even
had both installed at the same time.

4315. CFN chat 11:00 AM EST Friday

Newsgroup: comp.sys.atari.st
Date: 1991-12-27 01:39:48 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1991Dec27.013948.5026@usenet.ins.cwru.edu>
Source record: 227346

If you can make the Free-Net chat, it will be on Friday at 11:00 AM.

The channel will be +AtariCon

The TELNET address is 129.22.8.75

If you have an ID on Free-Net, you should login, go to the Free-Net
terminal setting by "go terminal" and make sure it is set to "VT100"
or "ANSI" or some kind of smart terminal that your program can emulate.

After you set it, make sure your computer is set to the same.

Then type "go cafe" and pick multi-user chat.

You should then pick a nick name by "/nick (name)".
Then choose the Atari Conference by typing "/join +AtariCon"

If you don't have an ID and can telnet, you may want to get one for
future conferences.

This conference pertains to a letter a group of individuals are sending
Atari to make sure Atari's next generation computers are the best
that we believe they can be.

See you there.

Len

Look. My reasons for not wanting to purchase anthing from Branch Always have
nothing to do with "rudeness." I have heard horror stories about customners
whose checks were cashed for fixes that didn't correct the problem they were
having, people told "tough" when they had a problem, etc. These are _support_
issues_ not the "views of the programmer."

Besides, there are other ways to increase screen performance including
Turbo ST,
processor accelerators, and the blitter as has alreay been pointed out.

>
> I also have problems with uud. Can anyone help?

Hmm... I use uud version 3.3, which I got from atari.archive ages ago
(back when it was still terminator) - have had absolutely no trouble
with it at all. I have had problems with .lzh files - sometimes I
have to juggle around to find a version of lharc that will unpack a
particular file.

I don't know if uud has much in the way of error checking - it lets me
know if it doesn't find the next file, but that's about it. Could it
be that your comm link to wherever you read Usenet is flaky?

I'm writing a story on the history of Atari for San Diego's ComputorEdge magazine, and need some background information on some of the hardware (OK, most of the hardware. . . .)

To wit: what differentiates the STfm and the STe from the straight ST? How are the Megas different (as well as Mega STe)?

Was the 2600 game machine the first Atari home machine? Did Bushnell sell commercial arcade games before his home machines? What are the significant featuers of the XE/XL 8-bit machines?

Thanks in advance for your e-mail responses!

Happy Holidays,

Jim

There are UUCICO's available on Amigas and Macs, with source in 'C'.
Has anyone tried porting these, or is there something weird about
UUCICO I don't kno about?
What about porting on from MS-DOS land?

>Hmm... I use uud version 3.3, which I got from atari.archive ages ago

I've been using a version that says......

Almost foolproof uudecode v3.4 (unix) 25-Nov-88

Usage: uud [-n] [-d] [-s dir] [-t dir] input-file

Option: -n -> No line sequence check
Option: -d -> Debug/verbose mode
Option: -s + Source directory for all input files
(MUST be terminated by directory separator)
Option: -t + Target directory for all output files
(MUST be terminated by directory separator)
If input-file is - then stdin is used as input-file

For a long...... time now. I have the source code to both it and uue
and they both compiled very nicely under the current (here anyway)
version of Ultrix where I use them. No problems what-so-ever.

Not unless you provide an indication of what sort of problems
you're having.

I've found uud quite reliable except for one instance, and that
involved files from BART (atari.archive.umich.edu) that had bizarre
filenames.

My GEM-based encoding/decoding program, UUCODER, has some filename-munging
routines to manage BART's filenames.

Speaking of Ethernet, I see on the .forsale groups that Mac SCSI <-> Ethernet interfaces are fairly cheap ($400.00 U.S. or so). Does anybody anywhere support this (these ???) board for the ST? It would be by far the best solution for me.

Didn't Atari make a thing-a-ma-jig that you hooked to both your stereo and your TV that made colored patterns on the screen depending upon the sound inputed? I know that they _did_ make such a device, as we were shown one at a user group meeting back in the 400/800 days, and I know it pre-dates those devices, but I'm not sure when, what it was called, or just about anything beyond what I told you above! (Give me a break, it's been a few years since that meeting...)

Message-ID: <1991Dec28.084411.7873@magnus.acs.ohio-state.edu>
Source record: 227362

I just recently got a bunch of old ST motherboards. 3 are revision B, and also 1 each of revisions C & D. Do they all have TOS V1.0 on them? I know my old revision B boardd does. Also, is there a program which will identify OS version, etc. I couldn't find anything immediate.

In addition, could someone please tell me the differences between these revisions, especially since the D seems quite different from the B & C models.

Please advise me through E-mail, & if there isn't already a document somewhere about it, I'll summarize what I find out later.

Thanks, <Mowgli>

most of the "other" uucico packages are based on the uupc project started by some folks at van-bc which in turn was based on lamb's dcp code. A few years ago, I got the ST port of uupc working but it had a hard time keeping up with 1200 baud and failed at 2400 baud. The mercury uucico run just fine at 9600 baud via a trailblazer t2500 modem.

If I was going to take on the job of porting a uucp package, I'd port andrew derbyshire's(?) rework of uupc for dos and os/2. he has fixed protocol bugs, code bugs, improved performance and added a good mail package. Currently it punts on news but I'm sure it hermes could fix that.

andrew's uupc requires an ansi compliant compiler to handle the function prototyping and other ansi-ish quirks. Sounds like a job for GCC!! :-) Other trouble points include how unix file names are translated into dos/tos file names and how files are spooled.

IMHO, other uucico packages would be more difficult to port and provide a less reliable implementation of UUCP. The one exception would be VMS UUCP which is a very good implementation of UUCP that is only hard to port because it is hardwired to VMS.

good luck!

4335. Re: Hermes UUCP package

Newsgroup: comp.sys.atari.st
Date: 1991-12-28 20:39:34 UTC
From: adrian@cs.UAlberta.CA
Message-ID: <adrian.693952774@steele-lk>
Source record: 227367

Several people have mentioned that they'd like to see a UUCP port that
works under MiNT. I'm porting Ian Lance Taylor's `Taylor UUCP' to
MiNT. I'm in the final debugging stage; it works mostly, but there are
some reliability problems which I think are related to modem I/O.
I will put it on atari.archive when I figure it's stable enough.

I've also got ports of Smail and Elm underway; Elm almost works, and
Smail I haven't got as far as testing yet. (-: If anyone wants to
beta-test some of this stuff, I'd love to hear from you. Mail me at
adrian@secret.uucp (try `adrian%secret@cs.ualberta.ca' if your site has
old maps and can't find secret by itself.)

A Segue: does anyone have a solid, compact implementation of the Bourne
shell working on the ST, preferably under MiNT? I don't mean Bash, which
is a pig. I have a port of `ash' (Kenneth Almquist's Bourne-shell clone)
underway, but I haven't had time to debug it -- anyone want to take over?

4336. Need STE_FIX.PRG

Newsgroup: comp.sys.atari.st
Date: 1991-12-29 04:08:10 UTC
From: rjung@aludra.usc.edu
Message-ID: <klqihaINN2uf@aludra.usc.edu>
Source record: 227369

Help! I'm trying to find a copy of STE_FIX.PRG, and I can't locate it anywhere.

For those who don't know, STE_FIX.PRG patches a bug in TOS 1.6 (not 1.62). This is the bug where the STe, when attached to a color monitor, will not boot in medium resolution. STE_FIX.PRG solves the problem and makes the STe properly read the DESKTOP.INF file so the computer boots as it should.

If you have a copy of this program, or know where I can find it, please send e-mail. I've checked most of the major anonymous FTP sites (including the Atari archive at terminator), but have not been able to locate it. If you could send a uuencoded version of the program, I would truly aprpeciate it. Thanks in advance.

4338. Serious hard drive troubles

Newsgroup: comp.sys.atari.st
Date: 1991-12-29 08:58:21 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4589@oucsace.cs.OHIOU.EDU>
Source record: 227371

I have an ICD host adaptor, an Adaptec 4070 RLL controller, and an ST-277R hard drive. Throughout the life of it I've noticed a "Sense $11" code being returned quite often in certain places, but never had any actual bad sectors show up (except one or two every now and then). Then not too long ago, I started getting bad sectors which would go away if I turned the drive off and turned it back on again. I had the good sense to back up most of my data at this point.

Then about a month ago the hard drive suddenly gained about 100 bad sectors, mostly centered in a few clusters. It totally wiped out a lot of files (almost all of which I'd backed up except for the newest ones ... no big loss except for a class project). I then reformatted it, repartitioned it, and all the bad sectors went away. Incidentally the sense code was still the same, ie $11. I restored all my files.

Then two days later I suddenly had another 100 or so bad sectors, this time just about everywhere (but still centered in clusters). Along with a sense $11 I started getting occasional sense $14 codes. Again I reformatted, but I'm afraid to go back and reinstall everything (except for what I need) because I'm sure this will happen again. Even after reformatting the second time, Cleanup (the ICD program) notices sense $11 codes in the areas that later develop bad sectors, but currently there are no bad sectors (you can also tell because Cleanup will slow down and sit at the suspicious sectors, but it always returns a verdict of OK. This happened last time, two days later they went bad).

In the mean time I need a hard drive that works. I'm probably going to order a new drive and controller. I also can't use my floppy unless the hard drive is on (the floppy is out of alignment, but it is magically *in* alignment whenever the hard drive is on. It doesn't have to have booted from the hard drive, I can just turn on the hard drive after the computer and the floppy will still work OK. But as soon as the hard drive is off, the floppy can't read a single disk. Go figure).

So. Anyone have *any* idea what's going wrong here? The only appliances near the computer are my printer, which has the power supply in a module on the floor, and the modem, which sits on top and also has the power supply module on the floor. The cable seems to be good. Running the format program with 16 verify passes of each sector turned up no problems (and took all night). I'd really prefer not to have to get rid of this drive, 65 megs is a lot to throw away.

Please email all responses, thoughts, suggestions, flames, etc. Thank you for your time.

I know of some people who modify their TV's to do such a thing and I've
heard it called "Waste-a-vision." What Atari called it I've no clue.

The problem lies in the Seagate mechanism itself. Many 1/2 height
Seagates make after 1986 (and especially new ones) suffer from poor
platter coating. This is due to poor factory conditions (their
clean rooms are, well, not). It sounds like the coating on your
platters is giving way. You will have to replace the drive mechanism.
I suggest you get either a Quantum or Maxtor drive. You can get a 130MB
Maxtor SCSI embedded drive (3.5 inch, low profile) for under $370 (I
did).

4343. At-Speed

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 04:55:44 UTC
From: meyer@milton.u.washington.edu
Message-ID: <1991Dec30.045544.25294@milton.u.washington.edu>
Source record: 227385

I am just days away from purchasing At-Speed, probably from Arthur Brown Comp. Their catalog price is $369.95. They also offer a TC Power-Emulator Memory Manager for $49.95.

My question is. Was the TC Power-Emulator Memory Manager originally sold with the AT-Speed board? Has it been separated to make the boards price more attractive?

If TC Power is a sparate product does it work well as an extended menory manager?

4344. Atari TTM195 Monitor

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 11:14:17 UTC
From: jonal@sofus.dhhalden.no
Message-ID: <jonal.8@sofus.dhhalden.no>
Source record: 227378

Reading the Seybold report in the latest (#53) issue of Z-Net, I saw a price for a monitor I've never heard of. The Atari TTM195 was quoted at US$1400,-, some 400 bucks more than the standard TTM194 1280x960 mono monitor.

Does anyone have more info on this on? Is it a 21"/24" thing or is it a greyscale monitor for use with a new video card. I know of a German monitor which can give 1280x960 in 256 greyscales when used with one of the Matrix cards.

Any info appreciated...

4345. Another Pexec-question

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 11:39:52 UTC
From: D11K@br4.hrz.th-darmstadt.de
Message-ID: <1991Dec30.113952.20091@infoserver.th-darmstadt.de>
Source record: 227379

Hi again,
first I like to thank everybody to re4ply to my previous problem.
I found it myself lately: the Pexec-mode 4 needs the Basepage-address
as THIRD parameter and not as second, and second and fourth must be zero.
My doc was wrong. Well, this was fixed easy. But now I have a much harder
problem...
I write a utility-routine to start other programs. This routine is part
of a CommandLineInterpreting-code and should be coded shareable, that
means, the service is called via TRAP (For VAX/VMS-knowers: I implement the
CLI$xxx-routines and some SYS$xxx). Thus, the code is running in supervisor-
mode and is using (at least until my traphandler starts) the system-supervisor-
stack. Then I switch to my onw stack.
Now, when starting the next image (program), which uses the SAME routine for
other purpose, i found that the Pexec-service will switch the supervisor-stack
back to any location in the system-memory (down in 0x1000 region or so).
So what happens: Since the new program follows the same calling-scheme it will
enter the quenstionable routine at a specific time with the SAME stackpointer
than the previous PARENT-image. See what will happen: When the child-process
is finished, the old stackinfo is overwritten by the child and the calling
routine (now back in the parent process) will return with RTE to the wrong
address, an address in the childs process-space,not longer valid.
My question:
How to avoid having the Pexec-routine change the Supervisorstack-ptr??
Or, how to change the supervisor-stack in the childprocess WITHOUT changing
the process-mode from USER to SUPERVISOR (Yes, no 0x20 TRAP1 function wanted!)?
Thanks again...
Mathias Gaertner, using the account of my Boss, Dr. Eder.

4346. Re: Quick ST support

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 12:57:19 UTC
From: csx18@seq1.keele.ac.uk
Message-ID: <1971@keele.keele.ac.uk>
Source record: 227380

Just to add my .02... I tried to buy QST twice, and failed! I tried to register when it was shareware but they lost my mail in a reorganisation, or something. Later I tried to buy it, and ended up with
1) No Quick-ST
2) Them having my credit card number.

I was recommmended to an English dealer (who only had an old version with no plan to upgrade) or to 'phone America (which would cost almost as much as buying the program!).

For me, which is best of QST or Turbo isn't the question. I'd buy QST if I could, but after two tries I'm fed up and nervous of risking it again..... If one of the big shareware/cheapware distributors carried it I'd buy it like a shot...'Goodmans PD' are agents for a great deal of shareware, for example, and sell stuff costing more than QST.

Mechanisms to buy software reliably exist. Until QST is available through one, I'm not trusting my money to someone a long way away with a bad record.

4348. RF modulator for ST's

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 18:45:43 UTC
From: marra@ldgo.columbia.edu
Message-ID: <1991Dec30.184543.28856@lamont.ldgo.columbia.edu>
Source record: 227381

I keep running into color/mono incompatibility problems for my monochrome system that no software seems able to solve. Does anyone know if there is any hardware available to get an RF output from a circa. 1986 520ST? That is, is there anyway to 'upgrade' an old ST to an STE? It seems my only options are to buy a color monitor ($350) or an STE ($399). For the STE, what is the screen resolution on a TV? Thanks for any help.

4349. Mega STe and STe GST shifter numbers....

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 20:11:00 UTC
From: pegram@uvm-gen.UUCP
Message-ID: <1991Dec30.201100.3221@uvm.edu>
Source record: 227382
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Quite some time ago, Lars-Eric Osterud noted that newer Ste's and Mega Stes have problems with noisy DMA sound, with displaying Spectrum 512 pictures and with mono screens wrapping left if a program abruptly changes the display address. Sure enough, I noticed the problem on my STe using Lars' noisetracker player program, and with the Codehead's Artgallery program (a picture "slide-show" program). The mono wrap left is harmless - it'll switch back and forth between normal and wierd - but rather annoying.

Unfortunately, Lars is not a hardware hacker and while he noted that the chip in question was in location U401 on Stes, he did not get the Atari chip numbers of the good and of the offending chips. To make a long story short, I finally pried the right chip out of Best Electronics and can give both numbers.

Bad new Shifter chip: C301712-001

Good older shifter : C300588

This is the largest PLCC (plastic leaded chip carrier - aka socketed square chip) on the motherboard, at 80 pins, rather than 64 pins.

Right now, I'm missing one chanel of DMA sound (I hope I just mis-inserted the chip!), but I can display Spectrum pictures (checked at a friend's house) and my mono display is rock solid.

Good luck folks and enjoy my belated Christmas present.

bye,

Bob Pegram

P.S. I'll be trying to find out about MiNT and MultiGem soon - I have to clear off my hard disk before adding things! don't get your hopes up, MultiGem looks to be very much a ROM version specific "enhancement" (1/2 8-). RBPIII

>Electronics and can give both numbers.

Just an extra twist here -- My 4-megabyte 520STe had a similar problem
(bad displaying of Sperctrum 512 pictures), so following the net.advice, I
took it to the dealer have the shifter chip changed.

I was surprised to find, however, that on my machine there was NO shifter
chip! Rather, the shifter was an integrated part of a larger IC, so I
couldn't just "pop out the bad, pop in the new". Fortunately, my dealer was
nice enough to swap my motherboard for another that had the "right" shifter.

This is just to let anyone else out there know that, depending on what
'board you have, your shifter problem may not be so easily solved. Now my
Spectrum pictures display properly, though I can't say anything about DMA
sound or mono display shifting.

>P.S. I'll be trying to find out about MiNT and MultiGem soon - I have

Well, as a happy owner of MultiGEM, I can tell you that it's not a ROM
version specific "enhancement". It claims to work on any version of TOS
from 1.2 and up, and so far it seems fine. I did have problems porting it
from TOS 1.62 to TOS 1.6, but I re-installed the program and it worked great.

I'm interested in adding a hard drive to my 2.5 meg 1040ST.

Can any Atari HD experts recommend a reliable HD (I guess in the 40-80 meg range) from a quality mail order dealer? I'm looking for a complete plug in/ formating software/instructions etc as my knowledge of Atari HD's is very limited.

Approximate cost greatly appreciated.

Most of my Atari application are music related, though I'm considering buying a SPECTRE GCR Mac emulator.

Many thanks in advance.

Bernd

4353. Mega 4 ST for sale

Newsgroup: comp.sys.atari.st
Date: 1991-12-30 23:34:53 UTC
From: leonpoon@wam.umd.edu
Message-ID: <1991Dec30.233453.15655@wam.umd.edu>
Source record: 227389

For Sale:

- Mega 2 ST upgraded to 4 megs
- Atari SM124 Monochrome Monitor
- Internal 50 Mb Seagate 3.5" Hard drive (40 ms)
- Star NX-10 Dot matrix printer
- Atari SX-212 1200 baud modem

Many useful programs including Neodesk 3.0, Universal Item Selector III, Flash 1.6, Ultrascript, Turbo ST, etc.

SPECTRE GCR 3.0 (including ROMs and cables) which allows you to emulate Macintosh machines as well as read and write Mac disks. I have also at least 20 megs worth of useful Mac software that is 100% compatible with Spectre. Some of them are Word 4.0, Excel 2.2, Canvas 2.0, Mathematica 1.2, etc.

Because I am in the sciences, I have a specialized program I want to sell. It is a symbolic algebra program.
- Maple 4.3 for the ST (include all disks and manuals).

I want to sell the system for $1200 or best offer. Feel free to contact me at leonpoon@wam.umd.edu if you have any questions.

Leon Poon

>the AT-Speed board? Has it been separated to make the boards price more
>attractive?
>
>If TC Power is a sparate product does it work well as an extended menory manager?

I'd go for it Bent. But then again, I'm prejudiced...I've been using
ATSpeed for over a year now and have nothing bad to say about it. It is
not a full AT, but it does what I need for the most part. I'm interested
in seeing the user-base expand so that more gets done for it and its
users.
As for TC Power...I never knew that as part of the ATSpeed package. I
thought it was mostly for Super Charger...but I could be wrong about that.
In any event, I've got 2.5 meg in my ST and I use extended memory with
ATSpeed...via Windows 3.x. I should say, however, that
I've never really tried to use expanded memory... There are software
expanded memory emulators, but I understand they are slow.
Good luck,
Gerry

Here's a bit of Atari trivia...

A few months ago, I met a Micheal Groh, Dealer Sales Coordinator, and we exchanged business cards. I noticed that his card was multicolored, in contrast to Sig Hartman's (purple logos), and other Atari employees I've met (blue logos).

"ATARI" is spelled out in letters of different colors, and remembering that the colors refer to the different lines of products that Atari sells. So, in order, here are the "Colors of Atari" and the products they represent.

A blue ST computers
T green TT computers
A orange Video games (??) Lynx
R red XE computers
I purple IBM compatibles

Well, I'm guessing on the orange part of it. But I noticed that Lynx logos are orange. Could the Jaguar logo also be orange? Notice that the logos on the Portfolio are purple.

If your fingers really like typing WordStar commands, your best bet probably is to get a configurable editor such as MicroEMACS 3.11 or Origami. I think Tempus also may be configurable to that extent, but I haven't used it.

Sorry, R. J., but you rather proved my point above - you have
to reinstall for each new version of TOS. Has anyone gotten MultiGem
to run on TOS 2.0X?? I have MultiGem, just not installed. I took a
look at the install disk when I came up with that opinion, and no less
an authority on such things than our Mike Vederman (8-) declared
MultiGem a hack. DC Desktop and some other DC products tend (not always
guys, I know that!) to be TOS version specific hacks too. I mean that
the software works everywhere, but a lot of extra code for each set of
ROMS is included in the package for installation purposes. I only
object when conflicts arise, and unfortunately, one I was unprepared
for, did 8-(. Ahem, Mike V, will you ever get DataDiet to work with
MultiGem? Guess who got both programs at once 8-).

Oh, I see -- I thought you meant that MultiGEM would run _only_ on
TOS x.y. I never considered re-installation to be a major problem, myself.
All I know is that, while it's not perfect, I do think MultiGEM comes
closer to all-purpose multitasking on the ST than any other commercial
product that I've seen.

4364. Atari Portfolio archive at umich up to date

Newsgroup: comp.sys.atari.st
Date: 1991-12-31 20:31:44 UTC
From: swood@terminator.cc.umich.edu
Message-ID: <1991Dec31.203144.1515@terminator.cc.umich.edu>
Source record: 227404
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.laptops,comp.sys.handhelds

Well, I have been real busy with non-archive concerns as well as plagued with tons and tons of problems that have made it hard for me to do anything but paltry updating on the boondoggle of incoming files at the portfolio archive. But I just spent my New Years Eve working away into the wee hours of New Years Day updating the whole shabang.

I have changed the format of the majority of the files over to .lzh as this is the smallest compression type I could find and it seems to be resonably well supported, even though there are a few problems with compatibility between some versions. If this causes problems for anyone, let me know, as I have considered converting the whole thing (yes once again) over to zoo as it is almost as small, but a bit more supported. The only reason I haven't yet, is that I have not found a zoo archiver for the portfolio.

Another thing. As you are looking through the archive, if you come accrossed any files (.lzh) that have real messy filenames, please let me know. Seems that weiner's version of lharc likes to garble file names beyond all recognition upon compression into the archive. I think that I got to most of the ones that I did it to, but there might be a few that I missed.

Lastly, I accidentally deleted a few files in the process of shuffling things around, and I managed to recover all of them but one. If the person that sent me the copy of ptetris could please send me the copy of the file again, it would be greatly appreciated.

Otherwise, feel free to send more files. Now that I am once again up to date, I should be able to keep up with them faster. And feel free to forward any questions my way. If I can't answer them, I should be able to find someone who can.

swood

>Any info appreciated...

It's a compatible replacement for the TTM194 (same size, resolution, etc)..
The 194 is a Moniterm; I've no idea who makes the 195. There's no question
in my mind that the 195 gives you a far superior screen: much crisper, and
apparently (from what people at Atari tell me) much more reliable. I've had
failures on the 194 so perhaps I believe this...although my sample isn't
large enough to mean anything.

Is it worth $400 extra? I wouldn't venture an opinion on that.

You need a real color monitor to go with the Matrix - I don't really have info
on which ones are compatible , although I'm expecting some shortly...

4366. Re: GCC & GDB

This is for Marshall Lake, to whom mail has bounced. If you're not him,
press 'n' now.

In article <1991Dec31.145322.11393@irscscm.UUCP> mlake@irscscm.UUCP (Marshall Lake)
writes:
>Where can I obtain a copy of gcc and gdb? I've checked

Unless something drastic happened while I was gone and nobody told me,
they should be in atari/gnustuff/tos/gcc and atari/gnustuff/tos/gdb or
something real similar to that.

Perhaps the problem you're having is that they're not listed in Index.
Well, that's the next project. Try getting the file ls-lR.Z and then
grepping for gnustuff/gcc.

Lemme know if you have any other problems finding things here.
